Who said anything about loathing it? I just think it's highly overrated
and it doesn't suit my purposes much anymore. I am tired of the slow
file system, the lack of real DIB, the extremely inefficient
multitasking of the WorkBench, and the hardware shortcomings.

What do I use the Amiga for? I wrote a few MIDI programs for it that I
occasionally use, and fx modules I wrote for ImageFX using the devkit.
To tell you the truth though, most of the time I use it these days, it's
to test someone's claim about how much better the Amiga is at doing
something. And I almost always get different results for some reason.

Toad is about the ONLY company tha still regards Atari computers as real computers. Most of you guys still think of Atari as nothing more than a game platform and sell them as a simple game server. Its the users of Atari computers who have driven the prices down in private sales. A guy buys a 1040 for $700 and a few years later nobody will pay more than $50 for it. C'mon now folks, the hardware is much better than that. These are REAL computers, not nintendos.

Toad recognizes this fact and sells their stuff as real computers. They also stand behind their sales if something goes wrong. Toad currently sells a 1 meg 1040 for $199 and thats a very good and realistic price, but if a guy advertised one here for sale as an owner looking to sell his stuff, most of you would say thats too much for a 1040. SO admit it folks, either you have real computers or nintendos for sale in this group. I say that Atari made real computers and I bought them as such and will sell them as such when the time comes.

Has anyone seen the 20th anniverasary special edition Mac code name Spartacus?
If not, load up your web browser to www.macweek.com or macuser.com.

I want one but can afford the reported $9000 price tag. However, I am
excepting donations.. So send your unwanted pocket change to me...:-)

6. Re: x86 vs. PPC SPEC numbers [LONG] (was Re: Falcons are memory hogs!)

Newsgroup: comp.sys.atari.advocacy
Date: 1997-01-02 00:00:00 UTC
From: quinlan@sfu.ca
Message-ID: <5af1fo$l80@morgoth.sfu.ca>
Source record: 7051

Here is some information that I got from www.specbench.org:

Model Name: Alder
CPU: 200MHz Pentium Pro Processor
FPU: Integrated
Number of CPU(s): 1
Primary Cache: 8KBI+8KBD
Secondary Cache: 256KB(I+D)
Other Cache: None
Memory: 128MB (60ns fast page)
Disk Subsystem: 2GB ST32550W
Other Hardware: AHA-2940W Controller
SPECint95: 8.09
SPECfp95: 6.75

Model Name: PowerStackII Pro3000/200
CPU: 200 MHz PowerPC 604e
FPU: Integrated
Number of CPU(s): 1
Primary Cache: 32KBI+32KBD on chip
Secondary Cache: 1MB(I+D) off chip
Other Cache: None
Memory: 128MB EDO
Disk Subsystem: 2x2GB
Other Hardware: None
SPECint95: 8.00
SPECfp95: 6.31

So, according to SPECint, the Pentium Pro is 1.1% faster than a similarly clocked 604e. According to SPECfp, the Pentium Pro is 7.0% faster but the 604e compiler was generating IEEE precision instructions and not it's own faster and more precise instructions. Summing it all up, the only bechmark that favors the Pentium Pro indicates only a marginal difference at the same clock speed. Other benchmarks, such as BYTEmarks, decisively favor the 604e. Remember, also, that 250MHz 604e chips are shipping and the fastest Pentium Pro is only 200MHz.

Besides someone totally brainless, noone will claim an overall superiority of TOS when comparing it to NeXTstep. TOS is slim and hardware efficient, but in all other areas NeXTstep beats TOS hands down.

After spending hours searching for a way to set an environment variable
under 95 similar to NT, without using the autoexec.bat file, I have come
to the conclusion that the autoexec.bat file is still a very important
portion of the win95 system.

NT doesn't suffer this problem, and environment variables are easy to
set, alter, or delete, as long as you can actually get to the portion of
the variable you need. Try deleting a part of your path variable included
in the SystemPath. I spent 5 hours hunting for it, and finally reinstalled
to remove several entries in the path that were installed to the %SystemPath%
variable. Reinstalling everything was quicker. The registry will kill NT
as far as enterprise systems are concerned. Everything is difficult with
respect to it. Give me the simple 130 line config.sys file and total
control anyday. :P

Try it sometime.

Ron

Source record: 7056
Cross-posted to: comp.sys.atari.st,comp.sys.atari.advocacy,

I have a 40meg external mac HD, and would like to connect to my 1040. Is there a standard cable that would work? What would be the best driver/editor software to start 'er up once I get a cable?
Also, I'm looking for the best way to download software from my mac, and transfer it to the ST. I've had some success after unzipping, and saving to a 800K DOS disk, but looking for a more reliable system.
I've hooked the ST to my mac with a null modem cable before, and it transfered ascii just fine. would this be a better solution for transfer?

Thanks in advance,
Mark

> PC's don't need drivers for ''basic'' functionality either.

Yes, but "basic" in terms of what a PC and a Mac consider "basic" are completely different. For example, the Mac considers a GUI to be "basic", PC's don't even come with a CLI unless you boot one.

Sad to see you know nothing about OpenFirmware. OF requires drivers on the cards or in the machine, but allows the card to identify itself, and what it needs. Someone still needs to write the drivers, or did you think the Intel code would run on the Amiga without any changes?!

> You've just reduced the situation to where it used to be.
> Macs require their own special hardware.

PCI cards with OF require custom drivers for _all_ of the machines they support. They typically come with only PC/Intel support on the card itself though, and many times not even that. It's totally possible to make a single card that plugs into everything, but most vendors are too lazy.

Not really, I've yet to install one that didn't need a disk to be
loaded. On the other hand most of the Mac ones work without such a disk.

> >Mac video cards are plug-n-play as long as they conform to the MacOS's
> >guidelines just like a card made for the PC must have drivers that conform

> Precisely. The MacOS requires conforming hardware.

No, it doesn't, at least not on OF 2.1 cards (which all PCI cards are
supposed to be). Just like their PC cousins, they can have the drivers on
the card or the drives somewhere. The difference is that the main Mac
drivers are a lot more flexible.

> else merely requires a conforming driver interface. It is not too

They're "hidden" because you don't need them.

> If anything: Win95 plug & play attempts to be a superset of
> the Mac's.

True, but what of it? In my last call to Gateway they made me turn off
P&P on the ethernet card because it made it stop working. That's really
showing the concept of MS's P&P at it's best I'd say.

Depends on which password you are talking about. I assume this guy is merely referrnig to the fact that most people don't bother to change certain system user profiles (QPGMR springs to mind) and thus have a rather large gaping hole in their security. I think he is right.Don't bother trying any of my AS/400's though :-)

The Mac is no different. It just hides details from you and
restricts your options.

Furthermore, your information is just plain WRONG.

For quite some time it has been rather difficult to NOT
get a Microsoft GUI bundled with a computer.

Although, it is nice to have other options.

1 competing commercial PMT 32bit OS w/ GUI
2 competing commercial Unixes (PMT,32/64bit,GUI...)
3 freeware unixes (PMT,32bit,GUI...)

I am just not impressed with silly buzzwords. What you describe is
nothing more than a ROM BIOS. It is also quite unnecessary.

>what it needs. Someone still needs to write the drivers, or did you think
>the Intel code would run on the Amiga without any changes?!

I was never stupid enough to even consider that.

Although, despite such burdens, both Atari and Amiga have been
using PC expansion cards for quite some time. Before Macs even
considered it, Atari/Amiga were using cards that only came with
'PC/Intel support'.

These platforms don't limit themselves to 'VGA' functionality either.

>
>> You've just reduced the situation to where it used to be.
>> Macs require their own special hardware.
>
> PCI cards with OF require custom drivers for _all_ of the machines they

An open bus standard becomes meaningless if the card has to be
in any minutest measure, manufactured for any specific target
platforms.

>itself though, and many times not even that. It's totally possible to
>make a single card that plugs into everything, but most vendors are too
>lazy.

Businessmen actually obsessed with making money, imagine that?

What you're describing only adds unnecessary cost and wastes space
in a market that is viciously competitive. None of the other potential
platforms require such efforts. They don't waste time being prissy and
pretentious. They do what is required to interface to a given piece of
hardware.

Apparently, a PowerMac is not as up to the challenge as an Atari ST.

Listen you Apple stooge: I said multi-montior video card.

Take the blinders off for a few milliseconds, look through the
driver list of a Win95 machine (standard, Aug95 release, no mods)
and you will find STB's muti-frame buffer card drivers.

[deletia]

So? Where's the generic T6000, Rage II and CL 5434 drivers?
Where are the specific drivers for the ATI 3D Xpression+TV?
Where can I test a machine that might have a PC PCI video card
in it?

I'm not about to take your word that PnP won't explode into a
million mac-pieces under that situation.

Nationalism and regionalism is generally redundant.

The label is only regional in a very vague sense and quite possibly
may be general to the entire planet. What was specified covers the
region from Lisbon to the Urals. Superficially, the term is more of
an economic or social distinction.
```

You're still a petty small minded peasant.

The nature of my character will never change that.

So, we then end up with a situation where a freeware operating
system (Linux) has better hardware support than what is sometimes
```

the leading microcomputer hardware vendor.

This is especially strange considering that the Mac userbase is
estimated to be at least 20 times larger (than linux).

That kinda makes it wasteful for anyone else, now doesn't it.
That also reduces it to 'Mac' hardware, reducing significantly
the usefullness of a common bus standard.

BETTER was never the issue. Some clueless MacVocate attempted
to claim that it was impossible. Then other MacVocates attempted
to backpedal the assertion to be the level of OS support.

BETTER is also vague and subjective.

>
>With a Mac you can plug in multiple different off-the-shelf monitor

>only work one app at a time. Some cards support multiple monitors of

QUIT SPREADING LIES!

This is the DOS way of doing it. DOS has been fairly dead except
for gameplay for quite some time now. PC OSes provide virtual
devices like any other real OS.

>the same resolution... but the system doesn't know shit about it. (can
>you say cheesy hack?!)

The system doesn't need to know shit about it. All it needs is a
way to interface to the screen. On a well abstracted OS, the underlying
hardware and configuration of same should be totally transparent.

>
>The Mac was is far superior. <period> MS is lazy, and implemented a
>bad (limiting) design.... and users pay the price.

Actually, filling up all of your card slots, which tend to be
limited on a mac to begin with, is rather limiting. In this respect,
the PC solution is acutally better. Sure it is a bit lazy. However,
a lazy solution is likely to be less complex. A complex solution
will be easier to implement and to debug.

Somehow this tactic is horrendous on the PC but good practice on a
Mac. MacVocate hypocrisy in action once again...

With limited card expansion space and the price of larger monitors
(30"+) coming down. The usefullness of such a general solution
diminishes. A significant number of macs would meet or exceed their
expansion capacity doing it the 'Mac Way'. PC's would not.

>
>> Precisely. The MacOS requires conforming hardware.

>Nope... people add by making their cards compliant with certain system
>restrictions... just like windoze. There are often FEWER restrictions
>on the Macs than on the PC's. So where is the cost?

Start naming specifics. The only PC restrictions are the bus interface.
Even there, one usually has 2 or 3 options instead of just one. The
card would also need to be VGA compliant but, that is a very limited
specification. Otherwise, MacVocates would have nothing to hark upon.

>
>Apple designed their stuff better... it took longer up front, and more

>
>> MacOS plug & play is not a superset of Win95 plug & play.

>> That should be well understood and freely admitted.
>Anything
>> else is pure fraud.
>
>Superset? No... Win95 is a cheap hack that is meant to make up for a
>bad initial design (or lack of an initial design)...

Yes. Superset. Win95 has the liability of having to make up for
SOMEONE ELSES bad initial design. MacOS has no such hinderance.
That it succeeds in the absence of handicap is much like a person
with healthy legs outrunning someone with nothing but stubs and
then bragging about it afterwards.

>
>The Mac is well designed, with versitility in mind.
>
>Call Mac PnP a superset of Win95 PnPray is like calling a BMW a

SUBset. You're blathering.

>superset of a Model-T (with electronic ignition and after-market
>air-conditioning bolted on). Sure they both have wheels and a motor-
>but one is designed far superior than the other.

However, that is not the case at all. There is really very little
hardware difference between the two machines. You GROSSLY overstate
their differences. Most of the differences are in your mind. The
rest are primarily a matter of software.

Typical MacVocate pomposity.

>
>> If anything: Win95 plug & play attempts to be a superset
>of
>> the Mac's.
>
>It may try... but it falls far short of success.
>
>Mac PnP works.

It gives a man no bragging rights to outrun a man with a ball and chain.

It is MacOS in the subject line after all.
That it succeeds is more a matter of lowering the bar in its favor.

Like what? Without specifics, you're just blathering. Also,
if it is an intermittent problem, you might want to check
the hardware in question.

>and how they would work when they introduced the nubus. As for the
>rest of the PCI stuff, remember how backward the i86 system is.

Oddly enough, despite this backwardsness, Apple still adopted it.
It would be nice if someone could ordain an entirely new architecture
but, the PC market isn't that centralized. There is no 'Big Brother'.
The last PC vendor that tried it, got laughed at (MCA).

>
>It is amazing that any cards work. Apple may not be at the head of the

Odd that I have yet to have such problems...

Drivers for the STB 2 & 4 framebuffer cards are right there for anyone
to see in the Win95 drivers list.

The rest would be cards that would also require a driver to work with
the Mac assuming that such a driver even existed.

So, what chipsets were those again? S3? CL5428? CL5434? T6000? Rage II?

Nevermind that all of these work fine and require no drivers at all
in 'Mac Plug-n-Play mode'.

No, the Mac just specifies quite a bit more. There is no flexibility
there. It is a straight jacket really.

The above quoted macVocate text is a perfect example of MacNewSpeak.

BTW-onboard drivers nullify any point in using a multiplatform bus.

Such responses are the last attempts of feeble minds.
The Mac platform imposes certain restrictions based upon the
engineering models that it is built upon. Glossing over such
issues with ANY device is blatant fraud.

>
>> Users should know exactly what they're getting. They should

>
> They're "hidden" because you don't need them.

They also might curtail sales. Conventionally, such information
hiding is refered to as fraud.

Apparently, you don't think that the Mac would look very good in
the face of full disclosure. Otherwise, you should be more forth-
coming.

>
>> If anything: Win95 plug & play attempts to be a superset of

More potential gain from more potential risk.
Dealing with 15 years of legacy that the market won't
allow you to simply sweep under the rug.

>P&P on the ethernet card because it made it stop working. That's really
>showing the concept of MS's P&P at it's best I'd say.

That would mean that the card was never working actually...

What will this do to the current price structure?
NextStep currently sells for $800-$4200.

This has little to do with the OS actually. The vendor is pampering
the user. Some Win vendors choose to do this, others do not. It is
hardly an OS boasting point.

Or, rather, that that machine uses what hardware it does have more
efficiently. The entire point of multi-tasking systems is to maximize
concurrency on hardware that supports such things. That mix appears
to flex most of his parallel operable components at once.
```

It shouldn't slow down user responsiveness. It shouldn't starve processes either. Some may get low priority but, that's the entire point of batch processes to begin with.

If we wanted them given maximum priority, we'd nice them or bring them into the foreground.

The only things that should flex the CPU is the renderings. Those can proceed at sub-optimal speed because they're batch jobs. The rest should put no more than %10 load on even a 486/100.

Don't make us laugh! Your ramblings sound like the dellusional rantings
of a troll. There should be no '10x CD drivers'. They should all either
be EIDE or SCSI. Plug them into a real HD controller and they'll be fine.
They'll be plug & play even under Linux.

Joysticks are even more trival. Just plug the damn thing in.

Actually, according to the company man, Quickdraw is just another
version of OpenGL (or DirecX). Since my 2D only PC card works just
fine with OpenGL, a VGA or EGA card should do just as easily...

Mac PnP still turns into VGA++.

So? What will QuickDraw do with a T6000 card? Blow Bloody Chunks?

> >regionalism. Neither contributes to your logos.
>
> Nationalism and regionalism is generally redundant.

Um, shouldn't that be "Nationalism and Regionalism 'are' generally redundant?" Regardless, that is an entirely untrue point. An individual purporting that, say, the NAFTA economic system is superior to the EEC is engaging in regionalism. A Canadian extolling his country as superior to all others is engaging in nationalism. Neither is mutually exclusive, but this does not equate them.

>
> The label is only regional in a very vague sense and quite possibly
> may be general to the entire planet.

Perhaps, but your labeling him as stupid or unable to comprehend certain societal and economic conditions due to his European origin is hardly non-regional or "vague." It is like saying that an American cannot understand socialism due to his capitalist nation's system. This is a fallacy of 'capital' order.

>What was specified covers the
> region from Lisbon to the Urals. Superficially, the term is more of
> an economic or social distinction.

Exactly, and has little (if any) validity as a judgment criteria for qualification, or lack thereof. If one was, for example, to describe himself as a chimney sweep with a second grade education, no computer knowledge, residing in London's Southwark borough, this would be an adaquate criterion to suggest that he may not be knowledgeable about Macintosh API programming theory. Suggesting, however, that a "European" has no concept of such economic and technical matters is sheer fallacy.

>
> You're still a petty small minded peasant.
>

This is the fallacy of the "red herring," in which a desperate/losing debater slanders/insults the opposing party in an attempt to escape the irrefutable logical points and provoke an emotional outburst in the recipient. When successful, the red herring allows the user to switch

to a topic more suited to his limited understanding. Unfortunately, yours did not succeed.

> The nature of my character will never change that.

An equally dubious fallacy, referred to as the "self-immolation" (self-burning) fallacy. This fallacy positions an attack upon a logical fallacy by an opponent as an attack upon the individual or a key component of an individual (such as character). This is designed to garner sympathy or lessen severity of logical scrutiny. Again, your tactic was not successful.

Usually, sticking to the topic is the most effective means of discussion, no?

38. Mac graphics cards Re: Mac OS primitive

Newsgroup: comp.sys.atari.advocacy
Date: 1997-01-04 00:00:00 UTC
From: crobato@kuentos.guam.net
Message-ID: <5akce4$dk6@lehi.kuentos.guam.net>
Source record: 7083
Cross-posted to: comp.os.ms-windows.nt.advocacy,comp.sys.mac.advocacy,comp.os.os2.advocacy,comp.sys.amiga.advocacy,comp.sys.atari.advocacy

By the way, I just installed an IMC 1724PDS graphics card for my 6300.

I unscrewed the back panel, and then I pulled out the tray containing the mother board completely out of the machine.

The board has pin edges right across it's back and connects to the peripherals with a very long connector deep in the back of the machine. There are absolutely no ribbons whatsover.

I punched out the preset holes for the port opening, and I carefully inserted the card over the PDS slot. The card looks more like a daughterboard, and there are chips galore in the top and the bottom. I gently pushed down the card, and the design of the PDS connector is strong enough to hold the card in place once it's fully inserted without need to screw it to the frame. I pressed a tiny red reset button on the motherboard with the screwdriver.

I placed the motherboard back to the rails, and slid it inside the machine. The backedge connectors made a slick, firm connection. I put the two screws in, tucked in the small metal handle used to pull the board out, snapped the plastic cover. Then I reconnected the Mac to the power, monitor, modem and printer.

I boot and wallah. Checking my Monitor Control Panel, the new resolutions are all automatically there.

I inserted my 1724 diskette, and I dragged and dropped the 1724 CDEV into the Control Panels. By default, Quickdraw Acceleration is already marked and enabled. Any changes on the 1724 Control Panel is immedietely active the moment the CDEV is closed---no need to reboot. You only need the control panel to enable or disable Quickdraw acceleration---on the fly, as well as to reassign the keystrokes for pan and zooming. All immedietely active the moment the CDEV is closed.

And without having to reboot again, I am already panning and zooming in a virtual deskop across different resolution modes and color depths that are being set on the fly.

Totally painless and plug and play.

I don't have to hunt and browse for some F*CKNG.DLL, SETUP or ST*PD.INF information file in "D:\WIN95" from the Display applet, after I have to pick a card from some long list or run a procedure that lets me wait for several long minutes to detect what card is that, which can happen unless you stop Windows 95 from doing it. Then after this trouble and you have all the nice graphics cards utlities set and all do all the tricks and stuff, installing DirectX would render all these utilities Completely Useless, and if you want these utilities

to work again, you have to uninstall DirectX or reinstall the drivers. And for all that trouble, you end up with an unstable system because the end result is a spagetti mess of different DLLs from different drivers. Guess what, I finally had to completely reinstall Windows because it needs to be cleaned up anyway, and then only to discover that in SAFE mode, which is the only way Windows 95 would boot up when it's all screwed up, that it won't RECOGNIZE THE CD ROM drive where my Windows 95 CD ROM is waiting. Worst, I can't shut down to pure DOS to start my DOS CD ROM driver. When I finally did so, Windows 95 SETUP won't even format or delete the old directory, so the reinstall procedure stopped somewhere. Jeez---And after spending many minutes in my file cabinet looking for that paper with my license number that you must enter in one of the many annoying questions in the Windows 95 install procedure. (Somewhere I was so closed to tears, had the strong temptation to break my CD ROM in half, and left a big crack in my PC casing after I punched it.) It's one disaster leading to another, and I finally rebooted my OS/2 Warp partition and from there, wiped out all Windows directories and assorted junk as clean as possible and run disk utilities to assure partition integrity before I rebooted again to my FAT partition and tried the install again. (My OS/2 partition sees my Windows 95 partition but not the other way around.)

"20th anniversary" ... "Mac".

Has a timewarp suddenly occurred, and we are now in 2004? (checks watch).
Nope. If the Mac was relased in 1984, and it was "designed" during 1983
as a replacement for the commercial failure known as the Lisa, then it is
only 13 years old.

Perhaps you are referring to the 20th anniversary of the 8-bit Apple. But
that was 1996. (The Apple][was a 1976 release)

> I want one but can afford the reported $9000 price tag. However, I am

"excepting donations".
Transalation: "excluding donations".
Meaning: Dont send any.

The in-context word our "friend" probably meant to use was "accepting"

(This is an error that any good librarian [as I am led to believe our
"friend" here is] would pick up in a cursory reading of the above quoted
two lines of text)

No, Toad is not the ONLY company. Computer Direct is pretty well
exclusively devoted to TOS and MagiC platforms. Toad is hyping their PCs
(with Gemulator built in) and their Internet service provider business.
They still sell Atari stuff, and provide support, but appear to be
winding down their involvement in the world of TOS computing. Computer
Direct, on the other hand, will only sell you a Mac or Mac Clone if you
REALLY insist, and steadfastly refuse to have anything whatsoever to do
with PCs. Check them out at http://compdirect.com. They are doing some
really amazing stuff.

Bill Merik
VERY satisfied Computer Direct customer and beta tester.

blink whaaa?
You are, in fact, aware that Quickdraw was around maybe ten _years_
before anybody was thinking about calling anything DirectX? Very strange
behavior.

This has been the situation since probably the Mac II in '87, definitely
since 32-bit Quickdraw in '89

What is so hard for you to understand? Any PCI card will work with the appropriate driver either on the card itself or installed by the user as an extension/control panel. This is the same as on any other OS.

I didn't even bother to reply to that joker who claimed that his 10x
CD-ROM drive requires a special driver for Windows 95. He just made it
up. For all we know, he could be a Macloser in disguise. I never knew
there's a 10x CD-ROM drive that's neither EIDE (ATAPI) or SCSI!

Don't worry, IBM is the greatest computer company in the world (maybe
even universe). I think OS/2 depends on 3 things:
a) IBM's research: which is exceptionally good and keeps producing new
products (I expect good voice output in 2 years maximum).
b) IBM's money: which they use for very good purposes (buying Lotus,
getting NS/2).
c) Lack of competition: Microsoft products do not stand a change, and
until Apple get the NeXTOS done, they also are no challenge.

Note that Java, NC, etc. is part of the research (Sun works with IBM
so well, I think they should join forces or something).

>such when the time comes.

I need to correct you in that you may TRY to sell your Atari for any price you wish to ask for, but finding a sucker to pay it is another matter altogether. I can go to local electronic discount resellers(USED) and find 1040ST computers stacked in bins for $30 to $50 each depending on condition. If you purchased your computer thinking it would hold its value like a fine collectable, you are VERY mistaken. Computers lose their value almost as fast as the ice-cream cone you purchase from a street-side vendor on a HOT summer day. If I constantly thought about what I have paid for hardware and what its worth now. I would NEVER buy another computer again...

Does NT support multiple monitors? Or does a special video card and
driver set? Can I take my NT workstation that I'm typing this on, and
add any graphics card I want and have multiple monitors? If NT
supports multiple monitors, then I shouldn't have any problems doing
it should I? If you answer that I need to buy a special video card,
then I don't think NT supports this...the specialized video card does.
>>

NT supports it if your driver supports it, some video drivers need to
use fixed addresses of hardware, so you could not place two cards
working simultaneously, some new PCI p&P video cards allow dynamic
reconfiguration for hardware, so you could use two standard cards
simultaneously, The trouble is on the Hard and on the Drivers, Not on
the OS, specially when the OS likes to controls so absolutely the
hardware as NT does.

Hi,

An ICD Link II would be the "cable" you need. It is more than just
a cable though. It is a SCSI host adaptor as well. It allows your
Atari's ACSI port to talk to the hard drive's imbedded SCSI interface.

It should be noted that some models of SCSI drives are not useable
with the Link II. If you can send me the info on the drive, I can help
determine the suitability for this solution.

As far as driver software goes, the Link II comes with software which is
not bad, pretty good actually. The best software to use in my opinion
is HD Driver.

If you have any further questions or need help determining whether or
not this particular drive is useable, drop me a line!

All the best,
Chris @ Computer Direct

Conflicting statements are hard to understand. You MacVocates can't
even get your minor, user level, technical details straight and you
seriously expect me to take your word on a matter of QA? Take a reality
```

pill.

Some of you attempt to claim that the core of Mac Plug & Play is
a matter of restrictive specification. If this is the case, it
severly cheapens past Mac success and casts serious doubt onto
whether or not it can succeed in an enviroment as complex as what
PC components provide.

>appropriate driver either on the card itself or installed by the user as an
>extension/control panel. This is the same as on any other OS.

However, MacVocates are seldom willing to admit that it would be that
simple on any other OS. If the Mac is emulating Win behaivor, and
rather new at it, it would not be entirely unexpected that the Mac
would be emulating that behaivor 'entirely'.

Regardless, I request verification: a not unreasonable request for any
one with a mind of their own.

Were you aware that you are concentrating upon a parenthetical footnote
while at the same time ignoring the prime focus of my statement?

One might get the impression that you're unwilling to address the
technical details of my statement. They might prove embarassing for
you. Instead, you rant on about red herring timing details centered
around a minor footnote. No one cares about ancient history. We are
not comparing Win85 to Mac85. It's time to stop living in the past.

You did not address the statement. How is QuickDraw not an application
level API layered over a standardized dumb frame buffer driver? Age does
not equal superiority; features do.

MacVocates are having a hard time coming up with usable non-esoteric
features that would make up for it's [Mac] position in the marketplace.

They're all 'special video cards' and 'special driver sets'.

Either way, even according to the apple company man, you're going
to need drivers buried down in the operating system to use any video
card on either platform. This is, if you want to use the full
capacities of the card you've likely spent a greater amount of money
on for the Mac.

Either you pay more for a card from a vendor that's macbending over
forward for you (increasing fab cost) or you're using only the very
basic functions of the card (and wasting that expensive card) or
installing a driver yourself (like everyone else).

Since the Mac isn't very capable of just plugging in any $40 PCI video
card, the Mac concept of 'plugging in any card' is quite a bit limited.

In this respect, plugging in yet another overpriced Mac board or an
overpriced speciality PC card don't leave much net difference.

However, the PC will be left with more expansion room afterwards.

Try reading your atari disks on a Win95 machine. Microsoft finally
introduced an Atari-esqe extended disk format for it. I suddenly
found that my Atari disks were readable after all this time. PC
hardware should have no trouble with Atari disks really. I'm not
sure what the problem was before...

Or, if that doesn't work: use a null modem cable and the corresponding
terminal emulation software. There are also more advanced serial port
xfer option but, I have no experience with them (ghostlink?).

> I am just not impressed with silly buzzwords. What you describe is
> nothing more than a ROM BIOS. It is also quite unnecessary.
>

It is pretty equivalent to a ROM BIOS. And, like a ROM BIOS, it is
quite neccessary. OpenFirmware is an open standard for interfacing OS's
and system ROMs to a system's onbaord and plug in hardware that is
required for booting. At a minimum this includes a bus interface like
SCSI or IDE and a mass storage device or a network connection like
ethernet (for net booting). If you want to be able to present a boot OS
selection to the user, OF driver code would also need to be provided for a
keyboard and monitor.

As the name implies, Open Firmware is designed to be implemented on many
different platforms including Sparc, x86, PowerPC, etc. It is used by
Apple and Sun and is part of the CHRP standard. Open Firmware drivers are
written in Forth and are not processor specific; the drivers are run by an
interpreter in the system ROM (kind of like a Java for booting). The BIOS
design is pretty x86 specific by using the x86 interrupt vector

mechanisms.

If a plug in card (like a PCI SCSI card) contains an OF driver, any system that implements OF may boot off of a hard drive hooked to the card. Thus, the SCSI vendor can implement one PCI card with one driver in its ROM and a user can buy this card for his Mac, Sun Workstation (they're working on PCI versions), or CHRP box, plug in his boot drive and be able to boot through the card. Once the OS is loaded, a better, processor/OS specific driver may be loaded for the card to get better performance. OF is mainly intended just to get things booted. Sun uses the trademarked name OpenBoot which is more descriptive for what it does.

Conceivably, everyone could have standardized on BIOS and written x86 interpreters in their system ROMs so they could run BIOS drivers on all of the PC cards. Forth (or some other interpreted language) seems a little more open.

As diplomatic as I try to be, I'm still called an "Apple stooge." I'm merely trying to point out the differences between Mac and Windows support for multi-monitors (either multi-monitor card support or multi-card monitor support). Mac can support multiple monitors and Windows can support multiple monitors. How they accomplish that is different.

Some people on this thread have talked about multi-monitor card support and some have mentioned multi-card monitor support. I have only tried to describe how each is supported by Mac and Windows.

> > Actually, Quickdraw assumes a dumb frame buffer unless a card has

>

The idea of dumb, bit-mapped frame buffers have been around a long time. I don't know when OpenGL was developed, but I know the Commodore 64, Apple II, and many other computers of those days had some form of bit-mapped frame buffer. A lot of games in those days used text mode as a form of bit-mapped (albeit with rather large pixels) frame buffer. I'm not claiming that Quickdraw's use of bit mapped frame buffers was revolutionary; it was actually a pretty well established technique at the

time.

> in it?
>

I've worked with ATI, Matrox, and Chips and Technologies to get their PCI video cards working on the Mac. The hardware was the same as they used in the PCs. The only thing that made them PC or Mac PCI cards were the drivers. One of the reasons Apple switched to PCI was so that 3rd parties could implement one piece of hardware and just have to do extra software for the Mac. Sometimes, even this effort is too much, though. This could be the case for T6000, Rage II and CL 5434.

> I'm not about to take your word that PnP won't explode into a
> million mac-pieces under that situation.

PnP shouldn't explode into a million mac-hardware-pieces. Just a million (well, only as many cards are out) mac-driver-pieces.

Your statement (well, question really) is correct. QuickDraw is an application level API layered over a programming interface with hooks for graphics accelerators layered over a standard driver interface to control a dumb frame buffer. Many of the bit blitting and other drawing routines call through installable procs to do their work. QuickDraw installs procs that do the drawing in software. Third party drivers may install procs that do the drawing using graphics acceleration hardware. I'm not trying to say that Quickdraw is superior in this respect, but rather I'm anwering your question.

> MacVocates are having a hard time coming up with usable non-esoteric
> features that would make up for it's [Mac] position in the marketplace.

I wouldn't argue that any of Quickdraw's features are superior to Windows. As for graphics, Quickdraw and the Windows architecture are mostly capable of the same things. The value any user puts on various features or a platform's position in the marketplace is highly subjective. Most users probably don't care that the Mac or Windows can support some configurations with more than one monitor. The statistics I've seen place the number of Mac users with more than one monitor at less than 5%. Mostly video professionals and software developers take advantage of multiple monitor support for the Mac or Windows.

> PC components provide.

You are confusing yourself. We say that plug-n-play works well
on the Mac because there is better integration of hardware and
software. YOU come back with a huge leap in logic that says
somehow this 'integration' bespeaks restrictive technology.
That is your term, not ours. You have assumed that the spec is
restrictive. it isn't. Mac video, for instance, Apple provides
SYSTEM LEVEL support to a frame buffer which will, without
any additional software, support any size monitor at any bit
depth from 16 colors to millions of colors, at any resolution
supported by both the monitor and hardware, and limited only
by the VRAM available in the accompanying video hardware.
And it will do so for as many video hardware boards as you
like. Want to run 4-21" monitors at 24 bit as 1 huge contiguous
screem? Just install three video boards and put 4 megs of
VRAM in the Mac's on-board video circuitry. The SYSTEM will
manage those monitors just fine with no additional software
to do so. Try that with a PC (without "special drivers").
Now, you tell me, where is the restriction? Any acceleration
that the hardware supports is provided by an extension supplied
by the hardware manufacturer. Apple has its own accelerator
for the on-board video and third parties supply it for their
boards. If you install 3 identical boards only one accelerator
extension is required for all of them.

I just installed an Apple 'QuickDraw 3D' accelerator board in
my Power Computing PowerCenter machine. I inserted it in
an empty PCI slot, restarted the computer, inserted the CD
that came with the board and ran the installer. In seconds,
the installer had installed the necessary software on my
machine and restarted. The installer is even smart enough

to know that the version of QD3D that I had installed was a
later version than the one on the CD and it did NOT try to
install the earlier version over the later the way many
PC installers seem to do. It worked perfectly the first time,
no 'autoconfigure' tasks to run, no bios settings to change,
it just works (BTW RayDream Studio now renders 3D so
fast that I can hardly believe it. Would you believe a 600 x
400 pixel 24 bit 3D image at 600 DPI in 12 minutes?). This
is hardly "restrictive technology"

There's one problem with your above assertion. How can the Mac
be "emulating Win behaivor" when the Mac had it long before
anyone ever heard of Windows (try circa 1985)?

OpenFirmware is part of the latest PCI specification. Cards that conform
to that spec will work with Macs.

OpenFirmware is a bit different from a more traditional ROM BIOS in that
it is not dependant on the machine it is plugged into. It allows
PowerMacs with PCI and PCs with PCI or Alphas with PCI etc. to access the
same cards with 'plug and play'. It is a way for the computer to
communicate and setup the card without proprietary hardware
specifications that are dependant on a particular machine's architecture.

Intel is part of the consortium that decides on the PCI spec. PCI is an
open standard, and Apple impliments PCI in it's PowerMacs.

> platforms.

I don't think he was correct here.

OF does not target any specific platform. OpenFirmware is independant of
the machine it is running on. It's vaguely like Java for expansion cards.
It allows different machines with different architectures to access the
same cards with out specific support for that platform on the card.

>
> Apparently, a PowerMac is not as up to the challenge as an Atari ST.

I don't thing he was correct. PCI cards that fully impliment OpenFirmware do
not care what machine they are running on as long as the PCI bus of that
machine conforms to revision 2.1 of the PCI spec.

It is supposed to be a machine neutral language for initial communication
with and setup of the card. Drivers are usually there to get the video
acceleration (at least on Macs... I don't know if a video card will
display anything on PCs without the driver; I have no experience with such).

I never claimed otherwise. The Mac's video driver architecture/ API is more robust than the Windows driver/API architecture. You aren't limited to just a view compatible cards for multi monitor support. SCSI is still more problematic even with Win '95 than it is on the Mac.

>

But, since the driver support is built in to the OS, you get less 'plug &
pray' compatibility problems that are rampant in the PeeCee world.

> Since the Mac isn't very capable of just plugging in any $40 PCI video

ATI (the most popular make of graphics cards for PeeCee) makes graphics
cards for the Mac as well.

The built in video on my PowerPC is capable of 1280x1024x16million. No
cards needed there.

For a so-called Jedi, you are a fool.

Yes.

There are many video cards that can do this, and some even support two
monitors with one card.

Try plugging in two PCI Matrox Millenium cards. NT will allow you to
set up a panning display with both monitors. Real neat.

Nonsense. QuickDraw is an API (like OpenGL). APIs are nothing new. Apple did not swipe the idea from OpenGL.

PCs use the same principles to accelerate some video operations as Macs.

Some of the functions in QuickDraw and in the Windows GDI can be done with the custom chips on the accelerator card rather than having the CPU do it. This is precisely how PCs and Macs get video acceleration when adding a graphics card.

I'm surprised that you're even making this an issue.

If the driver does not exist for the Mac, then the card won't do anything useful, but the sound card or the CD-ROM won't stop working when you plug it in (as could sometimes be the case with PCs before PnP conforming hardware from what I hear).

Umm.... no, I don't think I believe that one.

My roommate has a PC that has one PCI slot left. He has added nothing to his system since recieving it. That was the way it came.

PCI Macs OTOH have at least 3 free PCI slots. Those with 6 PCI slots don't come with on-board video and have one slot taken by the graphics card.

Neither is a set of the other. Arguing super/sub sets is totally
irrelevant in this case.

Arguing that Microsoft's feat of getting around a hardware design limitation
was rather impressive and that Apple had no such initial design limitation
to overcome might be more reasonable. Arguing super/subsets of
anything is not.

<snip>

We should pity the man with the ball and chain. Wait, no... we should
laugh at the man with the ball and chain for his foolishness because he
could have removed it long ago, but had chosen not to. Now, rather than
throw it away, he simply carts it around.

'Sure I could take it off, but look at the pretty cart I can tow it
around in now! Isn't it nice?'
-The Man With the Ball and Chain

> It is MacOS in the subject line after all.
> That it succeeds is more a matter of lowering the bar in its favor.

Yeah... PCs are really virtuous. The PC architecture makes it harder to do the same things other systems can do because these other systems were designed better. That sounds good.

Yeah right. The list price of a 4Mb Matrox is the same for a PC and the Mac.

>
> Either you pay more for a card from a vendor that's macbending over
> forward for you (increasing fab cost) or you're using only the very
> basic functions of the card (and wasting that expensive card) or
> installing a driver yourself (like everyone else).
>

Nonsense. I just installed a $250 video card on my Mac, and every function is immedietely available. The only software needed is to turn the card features off and on---without rebooting too.

> Since the Mac isn't very capable of just plugging in any $40 PCI video
> card, the Mac concept of 'plugging in any card' is quite a bit limited.
>

I would view a $40 card with great suspicion before I would plug into my PC.

> In this respect, plugging in yet another overpriced Mac board or an
> overpriced speciality PC card don't leave much net difference.

I see one Mac PCI graphics card (IMC brand) being advertised for I think $149. Does that sound overpriced to you?

This sounds like a contradiction to me. If it is possible to implement
sockets on cooperative TOS, how is it "utterly impossible" to implement
sockets on cooperative MacOS?

And I seem to recall seeing sockets running just fine on good ol'
cooperative Windows 3.1...

>And ? Will MAC OS8 be pre-emtive and have BSD-socket support like so many
>other decent OS'es like WindowsNT, MiNT, LiNUX, SOLARIS, IRIX, AMIGA-OS,

If MacOS 8 was still going to be done, yes, it would be preemptive, and
no, it would *not* have BSD-sockets support. It would have Open
Transport. OT is based on several standards which originated on UNIX
variants.

Believe it or not, BSD sockets are not the ONLY thing under the sun.

Judging from your tagline, your two primary operating systems are MagiC
and Linux. Interestingly, you would be better off with a PowerMac than a

Falcon, because you can run both of those OS's on one. Trust me,
literally any PowerPC will leave a 40 MHz 68030 in the dust. You just
have to be careful that the PowerMac you get is compatible with one of the
two PowerMac Linux releases (MkLinux or the semi-unnamed PCI Mac Linux,
sometimes called pci-linux or linux-pmac).

I don't trust BYTEmarks. They appear to completely fail to test memory
subsystem performance, which is a very important thing to measure in the
modern world.

>Remember, also, that 250MHz 604e chips are shipping and the fastest Pentium
>Pro is only 200MHz.

I wouldn't be so confident throwing a word like "shipping" around. The
fact that Power Computing has announced dual 604e-250 systems doesn't mean
you can actually buy one yet. I had a bad enough time trying to get hold
of a 200 MHz 604e card for my 7500; I ended up canceling the order after a
long wait and bought a 604/120 card for $99, which I clock chipped to 150
MHz. I shudder to think how hard it must be to get the 250 MHz chips.

SPEC results are almost always reported by the company that makes the
chips. Didn't you notice that the PowerPC numbers were from www.ibm.com?

>Let's see the numbers for DayStar, and Apple high-performance computers
>and compare again. And compare processors to processors, not IBM
>computers to Intel processors.

Intel uses Intel computers, based on a hot Intel motherboard. It is safe
to assume IBM does the same (the numbers for the 225 MHz 604e IBM puts out
are for 1MB L2 cache and 64 MB of SDRAM on a memory bus running at 75
MHz).

It is difficult to get numbers for DayStar, or any PowerMac. SPEC runs
only under UNIX. Right now, the only UNIX that runs on PowerMacs is
Linux, and neither port (the monolithic kernel port or MkLinux) has been
well optimized. (MkLinux in particular appears to be pretty slow.)

Even with an optimized UNIX, I predict that you wouldn't like the
numbers. Based on my benchmarking of my 7500 with John McCalpin's STREAM
benchmark, which tests memory bandwidth, PowerMacs have fairly anemic
memory throughput compared to common Pentium boards. As with any real
world benchmark, the programs in SPEC test memory bandwidth, though not
nearly as single-mindedly as STREAM.

Apple really needs to push the system bus speed well above 50 MHz, and
start using pipeline burst cache SRAM instead of flow-through burst to
take advantage of the high bus clock.

>

Card vendors do have to provide drivers for video cards on the Mac. The driver is used to set the resolution, refresh rate, bit depth, get the base address of the frame buffer and other things.

From what I understand of the Windows driver model, a Windows video driver must also provide functionality for setting pixels (I think this is the bare minimum, but would give you very limited performance), drawing lines, doing blits, etc. A graphics card vendor could get away with just providing VGA functionality and could then rely upon a VGA driver provided in Windows. This too would give pretty limited performance. Since most people are used to the speeds provided by graphics acceleraters, a basic VGA card wouldn't sell too well these days. The MacOS could provide a VGA driver out of the box, but there probably wouldn't be enough demand to warrant the effort.

On the Mac, if you want to enable hardware graphics acceleration, your driver would also need to provide functionality for drawing lines, doing blits, etc. as well.

a) Buy a new card & monitor
b) Buy a new card & monitor

Those two actions sequences are identical.

The solution is hardly 'special', support is delivered with the OS.
It's just not done so in a manner identical to somone else's solution.

Actually, DirectX just lays on top of the device driver. It is unclear
if, or how long QuickDraw has had access to a 2D or 3D hardware
```

acceleration interface. Without such a thing, QuickDraw is rather
limited. With such a thing, MacOS has to either have a driver api
or another iteration of it's VGA++ spec.

How many times by how many different people do you have to here that the
MacOS has had a driver API since the first Mac II rolled off the assembly
line in '87. Hell, even a programmer from Apple responded to this post.

A big dumb frame buffer is still just a dumb frame buffer.
My use of VGA++ was an acknowledgement of the fact that
Apple's version of VGA trumps the PC version. However, it
is still just VGA.

It was also a reference to Orwell that, aparently, no one got.

>And it will do so for as many video hardware boards as you
>like. Want to run 4-21" monitors at 24 bit as 1 huge contiguous

I'd rather just sink the money used to get the 3 extra video
boards into 1 better video card & use the money used in purchasing
4 monitors to just buy one with more screen area.

>to do so. Try that with a PC (without "special drivers").

Unless you want a dumb frame buffer, they're all
"special drivers" on either platform.

>Now, you tell me, where is the restriction? Any acceleration
>that the hardware supports is provided by an extension supplied
>by the hardware manufacturer. Apple has its own accelerator

It's not a 'special driver', its an 'extension'.

More MacVocate hypocrisy in action...

Odd that the vast majority of PC installers (of any kind)
ask when they are about to overwrite a newer version. Although,
installation utilities are the responsibility of developers and
not the OS vendor.

Try circa 1981. DOS 1.0 had the same level of PnP as MacOS
did in 1985: VGA++ (CGA).

Now, when MacOS finally got around to supporting a device driver
api is another matter. That has yet to be addressed by anyone.

Actually, PC VGA video cards are plug & play. Most of the problems
with multiple video cards stems from that (PnP) specification
being too specific.

Now, for non-trivial video functions: both platforms seem equal.
Both have to deal with the likes of Diamond and Matrox.

Ah, all of a sudden Apple is responsible for making something they didn't
design easy to use. Since ISA is brain-damaged past the point of repair,
your little challenge is absurd.

>your computer is going to be.

However, comparisons weren't being made between memory architectures.
Comparions weren't being made between entire whole systems either.

Comparisons were being drawn between two cpu families ONLY.

In that context, isolating the effects of the memory subsystem upon
relative performance is quite appropriate.

Uber-tests are really quite limited in an enviroment where you can
customize and fine tune nearly every part of the system. If a
particular system is an underperformer it is really quite difficult
to determine WHY that system was an underperformer. The benchmark
will tell you to avoid buying that particular machine but little
else.

Hardware elements have to fine tuned in order to isolate (as much
as possible) that which we want to derive information about.

One of my original assertions was that memory architecture was probably
more responsible for relative performance differences between PC's and
Macs than CPU speed in benchmarks that show a statistically significant
difference between the two.

I'm not dense. I just realize the implications of 'No drivers'.
Even the more technically literate MacVocates admit that 'No
drivers' severely limits the usefullness of mac video hardware.

>monitors as you have PCI slots. On some machines this is
>as high as six! No drivers, no drivers, no drivers. Get it?

It's a nice parlour trick. However, the restrictions imposed
by it would not impress any PC user. Dumb frame buffer cards
are ancient history for us and very substandard. This is
what you have to turn your overpriced mac video cards into
to achieve 'No drivers'.

This is rather pathetic considering the ~$1200/$3000 one would need
to spent (or have spent) on video cards/monitors.

Enjoying your life in Oceana?

>'drivers' out of your PC and see if you get any video. You won't!
>I can ALL of the extensions out of my system and I will still get
>video!

Actually, you rube, you can remove all of the drivers and still have video on a PC. This is known as VGA.

That is why I have been refering to Mac PnP as VGA++ you poor delluded fool. Had you been paying the slightest bit of attention, weren't blinded by your own advocacy or had any technical understanding, you would have seen that.

IBM PC video cards have always been PnP in that respect. Much like their newer Mac counterparts, they depend upon a driver burnt into the system ROM in order to function. VGA++, CGA85, TurboHercules...

I believe this statement is incorrect. First, all PC video cards that I'm aware of support the VGA standard. It's not that great but it is there. Second, the two video cards that I've got in the last couple of years have VESA support on the cards firmware (don't know about PCI cards though). I don't recall VESA driver in Windows 3.1 but GEOS has them.

Moron. There IS no ISA standard (that's one of the reasons the industry
has leapt into the arms of PCI wholeheartedly -- it's actually well
defined, as opposed to just sort of existing in ISA's case). ISA cards
cannot be autoconfigured. ISA cards assume x86 I/O space addressing, and
PC/AT style DMA and interrupts. ISA is, with very few exceptions, limited
to the PC.

What people have been trying to pound into your head is that OF lets you
write a OF driver in Fortran for your PCI card, burn the CPU-independent
FCode into the card's ROM, and then the card automatically works on any
machine with a PCI bus and OF. It doesn't matter what the CPU is, even.
You can plug the card into a PowerMac or a Sun; it'll work in either
machine, without even knowing or caring that the CPU is a PowerPC in one
and a SPARC in the other. If you want, you can supply as many
machine-specific drivers in the ROM as you like, or let the OS of the
machine in question use the OF identification facilities to automatically
figure out what driver, if any, should be loaded from disk.

You cannot do that with ISA.

You can't buy a single monitor with as much screen area (area = pixels) as four 21" monitors. AFAIK, the best you can do is somewhere around 4000 pixels horizontally, and that kind of monitor would put a much huger dent in your pocketbook than four conventional 21" monitors capable of 1600x1200.

Here is one thing I learned about PC cards. It's the cards that support Mac like features---gamma correction, multimonitor support, pan and zooming, virtual desktops---that are also making Mac cards.

Here's another thing. If I use install DirectX into a Windows 95 system, which is often installed by a game, all that fancy stuff above and my Matrox utilities under Windows 95, just went to smoke. I mean, literally removed by the DirectX video driver. Most annoying. You have to reinstall the original drivers to get them back. Annoying, if not subject you to unnecessary risk. Which is why I don't install DirectX anymore in my Windows 95 systems, and they're all happy as a pod for this. It's great to use pan and zooming to watch movies for example, and a virtual desktop is great when you have lots of things open in your desktop, (especially when you are in the internet and doing a lot of stuff simultaneously) things I am also using in my Mac with a graphics card.

But the nice thing about the Mac is that I can still play hardware accelerated games while still keeping all these features.

Give me a condition, under Win95, under which I need to reboot to change screen resolution. (That's what I referred to in "No it doesn't" above.) Then give me a situation, under Win95 SR2, in which I need to reboot to change either resolution or bitdepth.

I await your reply, Tom.

None of which have stood to any sort of scrutiny though. Mac cards can support hardware pan and zoom. They can support acceleration. They can support all the other features. In addition they can use drivers in the OS, on disk, or on the card itself. The Mac has done this since the 1980's, when the Mac II came out. They do this in all software. They have a single API. The card can tell the OS that it's accelerating certain things and not others, without changing the driver at all. You can run accelerated on one card, partially accelerated on another, and dumb on a third all at the same time. You can plug in an accelerating video card (or simply and accelerator with no video out) and have it drive all the other card, dumb or smart.

The same is simply not true for the PC world, even today. You simply don't know anything about how QD works, and that's becoming increasingly clear.

> It's a nice parlour trick. However, the restrictions imposed
> by it would not impress any PC user. Dumb frame buffer cards
> are ancient history for us and very substandard. This is
> what you have to turn your overpriced mac video cards into

The multiple monitor support works fine on any card, accelerated or not. You simply don't have any idea what you're talking about.

> This is rather pathetic considering the ~$1200/$3000 one would need
> to spent (or have spent) on video cards/monitors.

The ATI card costs the same as the PC version. In fact, I've seen it (here in Toronto, ATI's home) for LESS than the PC version. Macs can use all the same monitors as PC's. Once again it's clear that you don't know what you're talking about. I don't know what the psychological afflicition is that forces you to keep talking like this, but every word you post makes you look more the fool.

> Actually, you rube

Now name calling. I suppose it was inevitable.

After you install DirectX, reinstall your old drivers.

If your old drivers include DirectDraw support, then DirectX will work
just the same.

You *can* have the best of both worlds. :)

Here's what I found:

Using the standard S3 video driver supplied with Windows 95, when I went to resize from 1024 x 768 to 800 x 600, it resized the desktop to 640x480! It asked if I wanted to keep the new settings, to which I responded no! When I went to change bit depth from 256 colors to 64K, it asked me to restart windows.

The reality of practice would appear to contradict you 'Bright Eyes'.
Given that for 16 years, a wide range of PC motherboards have managed
to interoperate with a wide range of ISA expansion cards, your comment
is quite absurd given the available observations. When one considers
that this 'non-standard' has also been used by Atari ST's and Amigas'
with the same level of success: you are the moron.

ISA cards don't care what machines they are running on. A relatively
sophisticated de juere standard is apparently not required for them
to do so...

If the software can adapt to the hardware, you do need too.
The Mac seems to be the sole platform unwilling to do this.

Name one that is not.

I have an old 256k PGA card that is as plug & play as any Mac video
card. I'd just need to tell the OS to expect a change.

>
>> Most of the problems
>> with multiple video cards stems from that (PnP) specification

> Oh, this I gotta hear, what exactly is the problem here?

Reserved IRQs and BaseAddresses.
In a similar fashion, multi-IO cards are just as plug & play
as are most (8/16) soundcards.

The hardware is a bit overspecified however, the interface to the
OS is not.

>
>> Now, for non-trivial video functions: both platforms seem equal.

> Whatever.

If you wish to limit your hardware choices that's your perogotive.
However a PC user need not be so limited. Furthermore, a PC user
can impose such limits upon him or herself and obtain a level
of plug & play quite similar to that found on the Mac and yet still
have more options to choose from (than a Mac user).

I can just imagine what Diamond could to Mac Clone & Pray...

It's ABSOLUTELY the same as Alpha and PC, you need to have a Alpha
driver, and an Intel driver, yes, even though both will run under the same
OS. Do you know ANYTHING about this stuff?

Maury

That's normal - and I even said that above - because you're not running OEMSR2 of Win95, nor are you running QuickRes. As an easy and quick fix, grab QuickRes (it's perhaps 20k or 50k) and run it at startup. It goes into your little bar at the lower right of your screen and handles resolution changes flawlessly.

I repeat: there is no standard. Despite cards sort-of working all these
years, there has never been a centrally defined standard (in the
engineering sense) for the ISA bus. For 16 years, motherboard have been
able to interoperate with a wide variety of ISA cards, and the cards with
each other, in a hit-or-miss fashion. Probably the only reason that most
things work with one another is that ISA is very simple and (usually)
operates at a fairly low speed.

As far as use on other computers goes: I know with absolute certainty that
ISA was never available on the ST. The only expansion buses used by Atari
were various proprietary processor-direct designs and VME (which is an
example of a standardized bus, BTW).

I am nearly certain that on the Amiga, the use of ISA was limited to
"bridgeboards". The ISA backplane in several Amiga models wasn't
connected to anything on the rest of the motherboard. It held ISA cards
which interfaced to a PC-on-a-card, the so-called BridgeBoard which sat in
the one slot which had a Zorro (Amiga expansion bus) connector collinear
with an ISA connector. The Amiga itself could not use ISA cards at all.

There is a much better example for your side of the argument out there.
Do you know what it is? I do. (But it's not a very strong example, since
very few ISA cards will work in the machine in question...)

> ISA cards don't care what machines they are running on. A relatively

As I demonstrated above, ISA cards basically run on one architecture. You
are simply talking through your hat, as usual.

> Don't tell it to the Atarians or the Amigans. However, they aren't
> the types to let themselves be stopped by a 'barrier' or two.

> It's all just current running accross some wires after all.

Sure, but if you want to do anything more than programmed I/O with no
interrupts across ISA (i.e. very slow), you MUST have a good deal of the
support hardware present only in a PC. If the machine is not a PC, it has
to emulate that hardware.

>>What people have been trying to pound into your head is that OF lets you

> If the software can adapt to the hardware, you do need too.
^ ^
I am assuming that there should be a "not" under the first ^ and one less
"o" under the second, otherwise this sentence does not make sense.

You do not need to? Well, I suppose if you don't want to have automatic
configuration so as to avoid bugging the user by forcing him or her to set
jumpers and allocate IRQs and so forth, you don't need it. Frankly, I'll
take the other option. I'll take a method that lets radically different
machines use the same cards and automatically configure them.

> The Mac seems to be the sole platform unwilling to do this.

What a load of BS. You've been told repeatedly about the exact advantages
of the Mac driver model as opposed to the PC, but you are still trying to
blather about Macs not having any drivers at all. (Which was false.)

All right buddy, what KIND of video? Do you get 24 bits without drivers? Do you get support for ANY resolution on any size screen without drivers? Tell me about it! No, I'll tell you. You get 640 x 480 PERIOD. You get 256 colors PERIOD. because PCs require specific monitor card drivers to do anything else. Mac's system support for video may just be a dumb frame buffer, but unlike the PC, its a capable frame buffer. BTW, what does this 'Newer Mac Counterparts' crap mean. Macs had this capability when most PCs were still using DOS, Hercules mono, and 640 X 480 green-screen monitors. In other words, for a simpleton like yourself, Macs had it FIRST.

Another funny thing...as I mentioned above, it asked if I wanted to keep the resolution change, to which I had answered no. When I restarted the machine, it was at the new resolution. Also, when changing it back to 1024 x 768, Windows 95 told me that it needed to be restarted.

As for OEMSR2 and QuickRes, I realize they solve these problems but they are (using mac speak) extensions to the OS. I don't see any reason why this functionaliy couldn't be built into Windows 95 in the first place. Either way, I don't change resolution / bit depth frequently enough (almost never) to make this a very big inconvience

for me. But it is one of the many little things that combined together, make the mac the machine for me.

Josh

The BeBox supports ISA. Same for PPCP and PREP (these are PowerPC
common-platform designs). These platforms use a PCI<->ISA bus bridge
chip, a fairly common part.

The BeBox uses its ISA slots for a multi-I/O card and a sound card. You
cannot use just any sound card or I/O card, as they support only a few
models.

IMO it probably would have been impossible to economically put in an ISA
bus on computers like these in the past; it's only done now because very
cheap PCI<>ISA bus bridge chips are available. Designers don't have to
spend a lot of money on custom hardware to emulate PC interrupts and DMA.
It's cheap enough that it doesn't matter that you can't support many
cards.

With VESA you don't need a driver (a software driver) to take
advantage of higher resolutions.

With Win95 if you have a supported chipset you don't need an extra
driver.

In all cases _something_ tells your hardware what to do, but it's in
the ROM BIOS or the core of the OS.

As a former Atarian, I can say with no hesitation that no ST ever
supported ISA cards, nor could they have if they wanted to.

> > It's all just current running accross some wires after all.

For all intents and purposes the ISA "bus" is a backplane with the
8080's pins on it, much like the S-100 bus it followed. If you don't have
Intel IRQ's and such, it just don't work.

Yup. Since ISA only supports Intel-ish chips and support hardware,
that's somehow an advantage.

You need to use the right drivers - changing colors w/Diamond's tools don't require a reboot. In any case, QRes solves the problem. Why you don't want to try it is a mystery to me. Does your Mac use *no* non-Apple extensions?

If you need a 486 card, Orange Micro has them advertised in MacUser, MacWorld
and MacWeek.

Are you stating that Powermacs do not have the capability to run Wintel 3 and
95? If you state that, you are dead wrong.. Apple, Relys and Orange Micro have
Pentium cards. There is also SoftWindows..

The Be OS will contiunue to be developed for the PowerMac. PowerComputing will
ship a copy of the Be OS with all their units leaving the factory. At least 12
apps were shown at macWorld. Will see how it plays out. The Be OS is new,
moderm and has no legacy to deal with. Hopefuly with a decent web browser soon,
should put the Wintel/Mac to shame.

So what does this do to the Amiga? HP licensed some of C='s technology just
before they went under. About three years ago. C= at the time decided not to
go with PPC and instead use a HP risc processor.

What are those apps? I made a mistake with pricing. But $2700 is a lot for an
060 that is slow. Considering a Powermac 6400/180 can be had for $1199. Whats
your excuse for the high price?

I have owned a number of Macs, and a good number of PC graphics cards for my PCs throughout the years, but never installed a graphics card in my Mac before because they had always seemed costly. Until now.

Not only did the Monitors object recognize 24 bit color outright without installing anything, I get resolutions, real and virtual, all the way to 4088x1536.

Rgds,

Chris

129. Open Firmware?

Newsgroup: comp.sys.atari.advocacy
Date: 1997-01-11 00:00:00 UTC
From: petrich@netcom.com
Message-ID: <petrichE3ttwE.Ipx@netcom.com>
Source record: 6974
Cross-posted to: comp.os.ms-windows.nt.advocacy,comp.sys.mac.advocacy,comp.os.os2.advocacy,comp.sys.amiga.advocacy,comp.sys.atari.advocacy

Here's the picture I have of Open Firmware:

It uses a version of the programming language Forth (*not*
Fortran), an interpreter for which resides in the boot ROM of every
computer that uses OF. This is, of course, processor-dependent, but OF
Forth is compiled into processor-independent p-code that is what is
interpreted by this interpreter.

A device that understands OF would have some ROM with a driver
written in OF Forth; this will make the device usable in any environment
that has OF, regardless of processor type or whatever.

Thus, an OF multibooter would be capable of presenting a choice
of boot disks on one's screen and could interpret some keyboard/mouse
actions as making a selection.

Is that a fair picture?

Yep. You could easily write a multiboot program for OF.

>Possibly, but three different times...I doubt it.

Try Diamond's utilities and see what happens, then. I have a S64-DRAM
(2001-Video, Trio64V+) and Win95, both Aug95 and OEMSR2, work
flawlessly with the built in drivers, although the Diamond drivers are
nicer with the Aug95 release.

>>>As for OEMSR2 and QuickRes, I realize they solve these problems but
>>>they are (using mac speak) extensions to the OS. I don't see any
>>
>>OEMSR2 isn't an extension - it's Win95.

>I can't find a refernce to it on MS's home page. Could you enlighten
>me as to what OEMSR2 is? The way you are speaking, it doesn't sound

OEM - you know what that is.
SR2 - Service Release 2. All major clone makers now ship this release
with their new machines. It contains many major updates - MSIE3,
DirectX3, Mail, News, and much more. It's what I presently run on my
machines - that and NT4-S.

>like OEMSR2 is a normal feature of Windows 95, it sounds like an add
>on for it (or at the minimum some special configuration of it).
>Regardless, I shouldn't have to do anything special with Windows 95 in
>order to get this basic functionality.

Didn't you get a driver disk from Diamond? Why are you unwilling to grab one from www.diamondmm.com, if this is such an issue for you? I find it very suprising - I stay in 65k colors 100% of the time, and the only thing I change is resolution sometimes (rarely).

>I realize that with the right drivers and the right extensions, that I
>could get this functionality quite easily. The point is though, that
>I need the "right" drivers and these extensions to do this under
>Windows 95. I don't need *any* drivers or extensions to do this with
>the Mac OS. I believe that is what the issue is (or was).

Suffice to say you are one of the only ones I've heard of to have this sort of problem.

>The simple fact of the matter is that a user shouldn't have to go
>through all this trouble when better solutions exist. As I've said
>before, does this really affect me? Not really, I rarely have
>occasion to change video resolution / bit depth. But it is one of the
>nice things about the Mac that I don't have to do anything special to
>have this capability.

...and the Mac doesn't ship with a WWW browser (well, 7.6 will, if you can stand CyberPuppy). Which would you rather lack? Me, I'd rather get _both_, which OEMSR2 has, but if I had to do without one, and didn't have the ability to get one, I'd do without the ability to change colors without a reboot and I'd keep MSIE3.

In other words - big deal, HTTP it. I don't know why your machine doesn't work like all of the other machines around, including mine, which probably has a similar chip in it, but you -do- have a solution to your problem that's staring you in the face.

If you don't know, then why are you spreading FUD?

I'd like you to name a current DOS-compatible card _without_ VESA.
It's been a long, long time. The last card I remember using without
VESA was a Compaq QVision 2000+ graphics card, for which DOS support
was definately an afterthought (it was heavily optimized for Windows,
at the expense of DOS speed), but even that used a 3k program, and
bingo - it had VESA. Before that, I don't recall using a PC card
without some form of VESA, except the DOS Compatibility Card I had for
my Mac Centris didn't have VESA...but, again, a simple program took
care of that.

>>With Win95 if you have a supported chipset you don't need an extra

The standard in DOS is VESA, which, as we've been over, is on modern
cards.

>many drivers for a variety of graphics cards/chipsets, but this does
>not mean that Windows 95 has this functionality built in...it still
>requires a driver.

The driver is built in. Whether you consider that 'functionality' or
not is word play.

If you have VESA (I'll take your word that this is really true, as I don't know myself). There's that famous "if" that is always popping up in the PC world.

>With Win95 if you have a supported chipset you don't need an extra
>driver.

Yes you do, the necessary drivers are just included with the Windows 95 CD-ROM. But they are still different drivers. If a new video card appears on the market that doesn't utilize one of the common chipsets that ship with Windows 95, your going to need a driver supplied by the manufacture to use any resolution/color depth beyond VGA.

>In all cases _something_ tells your hardware what to do, but it's in
>the ROM BIOS or the core of the OS.

Yes...something does. The Mac OS has the basic functionality of displaying all resolutions with all color depths built into the OS itself. No need for a special driver to use all available resolutions and all color depths supported by the video card.

Contrast this with the PC. The PC requires a special driver to utilitize any resolution or color depth above standard VGA (which I believe is defined as 640 x 480 at 16 colors). Windows 95 includes many drivers for a variety of graphics cards/chipsets, but this does not mean that Windows 95 has this functionality built in...it still requires a driver.

George is entierly correct in what he is saying. It is another example of one of the small, but numerous things that make the Mac

more refined than a PC. How much weight this carries to the user can only be determined by the user. But it is still one other thing the Mac does better than the PC.

Josh

You wouldn't by any chance be using a Diamond based video card are
you? Diamond is notorious for doing rather goofy things with their
"standard" S3 cards.

The only redeeming fact is that Diamond is finally figuring out how to
do support for at least Win95 and WinNT 4.0. If you are using a
Diamond card, you should be able to download a "real" driver from
www.diamondmm.com. Just make sure you know whether you have a
Graphic, Video or 3D series of video cards.

Actually, these days you would be very hardpressed to find a non-VESA
video card for the PC.

>Contrast this with the PC. The PC requires a special driver to
>utilitize any resolution or color depth above standard VGA (which I
>believe is defined as 640 x 480 at 16 colors).

It depends on the OS.
Some OSes are limited only to VGA/SVGA (640x480x16 or 800x600x16).
Others are capable of using the entire spectrum of the VESA
specification--which I believe goes all the way up to 1280x1024x16.7
million colors (although, someone check me on that).

>Isn't this your home PC?

Nope...it is my work machine. At home, the only thing installed is Windows NT Workstation 4.0.

The work machine has both Windows 95 and Windows NT Workstation 4.0 installed. It primarily runs Windows NT with an occasional reboot into Windows 95 for various reasons (such as testing out video resolution switching for posts to the newsgroups :-))..

>>Another funny thing...as I mentioned above, it asked if I wanted to

Possibly, but three different times...I doubt it.

>>As for OEMSR2 and QuickRes, I realize they solve these problems but

>
>OEMSR2 isn't an extension - it's Win95.

You'll have to excuse my ignorance...I'm unclear as to what OEMSR2 is. I can't find a refernce to it on MS's home page. Could you enlighten me as to what OEMSR2 is? The way you are speaking, it doesn't sound

like OEMSR2 is a normal feature of Windows 95, it sounds like an add on for it (or at the minimum some special configuration of it). Regardless, I shouldn't have to do anything special with Windows 95 in order to get this basic functionality.

>>reason why this functionaliy couldn't be built into Windows 95 in the

>don't require a reboot. In any case, QRes solves the problem. Why
>you don't want to try it is a mystery to me. Does your Mac use *no*
>non-Apple extensions?

I realize that with the right drivers and the right extensions, that I could get this functionality quite easily. The point is though, that I need the "right" drivers and these extensions to do this under Windows 95. I don't need *any* drivers or extensions to do this with the Mac OS. I believe that is what the issue is (or was).

The simple fact of the matter is that a user shouldn't have to go through all this trouble when better solutions exist. As I've said before, does this really affect me? Not really, I rarely have occasion to change video resolution / bit depth. But it is one of the nice things about the Mac that I don't have to do anything special to have this capability.

Josh

If you are going to be an ass and close minded about it, why should I
waste my time?

An 060 may be too slow for MacOS, hell, a PPC is too slow for MacOS,
but for TOS and Atari apps it is plenty fast.

Price is all relative. perhaps this machine is worth more to a certain market than a slower 1500.00 PowerMac is?

All the best,
Chris @ Computer Direct

Voice output has been around a long time; my Amiga had it in 1986. But you qualified this as "good voice output", and since I don't know what you consider good, I can't really argue with your point. I thought the Amiga voice output was quite decent, and it was certainly understandable.

Voice output has always been much simpler than voice input. Heck, even a piddle-dunk outfit like Creative Labs has been able to cobble together a voice output program; they ship one with all Sound Blasters these days.

> b) IBM's money: which they use for very good purposes (buying Lotus,
> getting NS/2).

However, there is serious doubt about the extent to which IBM will be willing to *commit* that money to the OS/2 cause in future. The evidence is that IBM is cutting the budget on OS/2, not increasing it. They've got lots of money, but they're investing it elsewhere.

> c) Lack of competition: Microsoft products do not stand a change, and
> until Apple get the NeXTOS done, they also are no challenge.

I assume that you mean that "Microsoft products do not stand a chance". You are aware, aren't you, that Win 95 has now sold more than 4 times as many copies in just a year and a half as OS/2 has sold in its entire existence?

Win 95 is the fastest selling software product of all time. But I suspect you mean "doesn't stand a chance technically", not "doesn't stand a chance commercially". All I can say about that is, IBM and Microsoft will get profit from commercial success, not from technical success. A lot of people have gone broke producing products which were technically successful but commercially failures. I don't know whether OS/2 is a commercial failure, but it certainly isn't as successful commercially as Win 95.

> Note that Java, NC, etc. is part of the research (Sun works with IBM
> so well, I think they should join forces or something).

I don't recall that IBM had anything to do with the Java initiative, except for joining it like so many companies did. Java came from Sun alone.

Oh crap. They are streamlining the budgets of all divisions actually. It's like the US Goverment---productivity and emphasis is not the reflection of budget size. Efficient utilization of money is.

Fastest selling software of all time? You mean, the fastest preloaded software of all time. There are a lot of people dissatisfied with the product there. Sure, they encounter things like not enough memory to run it as fast as they wish it to be, or that it lacked the

proper drivers, or proved to be too slow for their systems, or took up too much space. Whatever the reasons are, they were sold with the promise of the product and that promise didn't get fulfilled. I just have a friend whose Win95 installation into her 486 notebook resulted in a dead unreadable drive and a black screen.

IBM has one of the most vigourous, most extensive programs for Java anywhere else on Earth outside of Sun. In fact, Java is a prime strategic directive for all IBM divisions.

That's strange. I have a Stealth 64 VRAM (the 3400XL V's precursor,
964 rather than 968, and I have a Trion64V+) and it works for me.
That's really odd. I'll have to look into that.

] and all color depths supported by the video card.
]

You do need a driver that knows how to program the video card to use a
video card. This is true of Windows and it is true of the Mac OS. In
most cases, the driver is on the card itself, so the user does not have to
install the driver from a floppy. Either way, there is a driver specific
to the video card. The Mac OS, just as Windows, needs a driver to be able
to program the card.

] Contrast this with the PC. The PC requires a special driver to
] utilitize any resolution or color depth above standard VGA (which I
] believe is defined as 640 x 480 at 16 colors). Windows 95 includes
] many drivers for a variety of graphics cards/chipsets, but this does
] not mean that Windows 95 has this functionality built in...it still
] requires a driver.

]

As does the MacOS. As do all OSs.

Wasn't too good for Lotus either. Oh yeah someone
rode off with a bunch of pocket money but in the end????

Ditto a co. that once was known as Rolm.

It was bad market strategy regards Lotus anyway. IBM never
tumbled to what was happening on the net. Remember PROFS??

"Sell" means that A gives B a product and B gives A money in exchange for it. Often B proceeds to then give the product to C in exchange for money.

A preload is a sale, Chris. Microsoft is shipping products to hardware vendors and the vendors are giving money to Microsoft. The vendors then include the product in a larger bundle, which they then sell to end users, in exchange for more money.

I don't understand this attitude that a preload is somehow not a sale and shouldn't be counted as a "real" copy of the product.

If I'm not mistaken, he needs to get the latest version of ICD's hard
drive software or HD Driver.... either one supports arbitration on a
Quantum Fireball drive and it is arbitration that is needed to recognize
the drive.

I don't know what applications he was talking about BUT one app that
does spring to mind which AFAIK is unmatched on ANY playform is Tempus
2, on my 8mhz 68000 it is the fastest text editor have ever seen, I've
not seen anything that can scroll at it's speed on a very fast
pentium, I'm sure that there is something that will run faster than it
but you will need a processor tens of times faster than a 68000 to do
it.

> getting NS/2).

Buying Lotus was the worst thing that IBM could have done for the future of OS/2. This is why so many 3rd party developers are abandoning OS/2. They now see IBM as competition, and they likely feel betrayed by IBM. They also know that they are not going to be able to compete with Lotus, now that it has IBM's deep pockets behind it.

Not to get off the topic but,

Diamond releases drivers that just plain do NOT work. Any problem
I've ever had with Windows 95 has always been some screwy company that
wrote drivers that outright SUCK. I think Diamond finally has the
drivers down for the Diamond Stealth VRAM 3000. Be sure to get the
latest release from their web site: www.diamondmm.com

Brad

The TI99/4A had it well before that. And for that matter, a few kids games ran on it with rudimentary voice recognition. The Voice output was quite good though it had to be programmed in to use the speech synthesizer.

And IBM has had a similar program for OS/2 and DOS for some time called Speech Reader. There are some web sites on it. The market is small though, limited to those with disabilities primarily. IBM also has Screen Magnifier for those with sight difficulties. My, it seems IBM cares!

>However, there is serious doubt about the extent to which IBM will be

>that IBM is cutting the budget on OS/2, not increasing it. They've got lots
>of money, but they're investing it elsewhere.

Oh? Like starting a division to concentrate on Networking applications and OS/2?
Like hiring 30,000 employees at ISCC in 2 years, of which will push all IBM products, including OS/2?
Like promising 20+ enhancements to OS/2 this year, and a new version next year?
And after just providing a new version in 96?

Ah Steven, quit the FUD.

>I don't recall that IBM had anything to do with the Java initiative,
>except for joining it like so many companies did. Java came from Sun alone.

And working with Sun and funding the development of apps has nothing to do with it? Nor making NC machines to use it? Or putting it into OS/2, AIX, VM, etc.?

Diamond 3400 XL Video using the generic S3 driver, you will need to reboot after screen resolution change.

Same card using Diamond's driver and OnControl utility, will change resolution and color depth on the fly.

I tried OS/2 2.1, and then Warp3 and they weren't bad.
However, the software I wanted to use and needed wasn't
available, and I gave up waiting for it. I went to Win95
and now WinNT 4.0 which I like a lot.

OS/2 probably is technically better, at least than Win95,
but I feel they missed their chance to really get a chunk
of the market when Win95 kept getting delayed. I don't know
why IBM can't seem to market very well.

: Fastest selling software of all time? You mean, the
fastest preloaded software of all time. :There are a lot
of people dissatisfied with the product there. Sure, they
encounter things :like not enough memory to run it as fast
as they wish it to be, or that it lacked the proper
:drivers, or proved to be too slow for their systems, or
took up too much space. Whatever :the reasons are, they
were sold with the promise of the product and that promise
didn't get :fulfilled. I just have a friend whose Win95
installation into her 486 notebook resulted in a :dead
unreadable drive and a black screen.
I'll have to say that when I was trying OS/2, there were a
lot of posts from people whose OS/2 installation resulted
in a dead system as well. Any OS of any complexity is going
to have installation problems on certain configurations. I
never had any problems installing OS/2, 95 or NT. Just luck
I guess.

I have a friend who is running Win95 on a 486/66 with 16M
RAM, and they are satisfied with it. Go figure!

:
I agree with you Steven.

If I remember correctly, IBM tried selling their systems
and notebooks with OS/2 preloaded, and they ended up
switching to preloading Windows just like everybody else. I
would assume, therefore, that preloading doesn't
automatically result in success for the preloaded product.

I get some catalogues from companies that sell computer
systems, and they preload Lotus SmartSuite on them as part
of the package. Should these installations be removed from
the profit picture and the user base calculations? I have a
couple of clients that purchases these systems, and the
first thing they did was call me and have me remove
SmartSuite and install MS Office, which they purchased on
their own rather than use SmartSuite at no charge.

I will grant you that MS strategy of charging for each
system sold whether Windows was installed or not did remove
incentive for manufactures to offer other operating
systems. I know that Dell allowed you to specify Windows or
OS/2 for awhile when you ordered a system from them, but I
don't think that lasted very long.

Good point, I'd not accounded for Be's implementation. But since it's
not P-n-P (my appologies to Be if I'm incorrect on this point) you end up
doing exactly what "JEDI" is claiming you don't have to - load drivers by
hand. In this case you'll need Be drivers in fact, and I'll bet their
even more rare than Mac drivers.

Personally I've always felt that ISA on the Be was one of the more
backward-looking features of the system. Is the availablility of slightly
cheaper Ethernet cards and internal modems worth the extra complexity and
confusion? I personlly don't believe so.

> The BeBox uses its ISA slots for a multi-I/O card and a sound card. You

If the OS/2 newsgroups are dying its because everything in Warp works so well and everything is so smooth that there isn't a lot to talk about. Frankly, I enjoy reading about all the Microsoft product problems. It reinforces the good feeling associated with knowing I made the best choice with Warp 3 and now Warp 4.

Spreading FUD about what? What have I spread that has been FUD?

All I said was *IF*. It is always comming back to an *IF* with the PC. If your PC has X, then you can do Y. There's always that *IF*.

Regardless, you still need a separate driver, it is now the VESA driver.

>I'd like you to name a current DOS-compatible card _without_ VESA.

Oh...then why was it suggested that I get the correct drivers for my
video card to allow me to switch resolutions / color depth? Windows
95 supplies built in drivers for the chipset built into my video card,
why should I need these *extra* drivers when Windows 95 already has a
supported driver? So, with that said, I guess that I still haven't
got it.

Everything that I do works nicely under NTW 4.0, so I don't see any reason to backstep to Windows 95. I'm sure I can get along just fine with Windows 95, but I have no reason not to take advantage of the power NT offers over 95.

It's not that I'm unwilling, I don't have any need to. As I've said, this really isn't an issue for me. I can't recall the last time I had to change resolution / color depth on my machine. I set it to the desired resolution, and forget about it.

>Suffice to say you are one of the only ones I've heard of to have this
>sort of problem.

Am I? Earlier you told me that I should get OEMSR2 to clear up this problem. I would be quite honored if MS included this ability in the

OEMSR2 release just for me, but I'm certain the reality is that they did not. Apparently others have the problem as well.

>In other words - big deal, HTTP it. I don't know why your machine
>doesn't work like all of the other machines around, including mine,
>which probably has a similar chip in it, but you -do- have a solution
>to your problem that's staring you in the face.

Why do you think that I have a problem? You, yourself told me to get OEMSR2 to gain this additional functionality. Since it was included with OEMSR2, I would imagine that I'm not the only one having problems.

Also, as I've said in the past, it isn't a problem for me. I don't change resolution very often (I can't recall the last time I did) to bother finding a solution for something that doesn't affect me.

What I am saying is, that the Mac OS has this capability built in, and has had it for quite sometime. With Windows 95, I have to download the "correct" drivers from Diamond, or install an aftermarket product or upgrade Windows 95 to OEMSR2 in order to get it.

Simply put, the Mac way is more elagent than the Windows 95 way. That's all I'm saying.

I would if this were a problem for me. But it's not. The only time I
can recall changing resolution / color depth was to test it out for
this discussion.

Just out of curiosity, what do -you- think that "power" is?

>Am I? Earlier you told me that I should get OEMSR2 to clear up this
>problem. I would be quite honored if MS included this ability in the
>OEMSR2 release just for me, but I'm certain the reality is that they
>did not. Apparently others have the problem as well.

In OEMSR2 they included the ability, with generic chipset-level drivers, to change color and resolution on the fly, whereas in R1 of Win95 they included only the ability to change resolution on the fly, and OEM manufacturers could then add features to the basic drivers. Any deviation from that norm is unusual.

>Why do you think that I have a problem? You, yourself told me to get
>OEMSR2 to gain this additional functionality. Since it was included
>with OEMSR2, I would imagine that I'm not the only one having
>problems.

I also said a normal R1 owner of Win95 (release one, August 95) can switch resolutions without problems; I don't know why you have them.

>Also, as I've said in the past, it isn't a problem for me. I don't
>change resolution very often (I can't recall the last time I did) to
>bother finding a solution for something that doesn't affect me.

Then why are you posting about this? To make your Mac point. And I've given you a fix, which I believe negates the Mac point - for the most part.

>What I am saying is, that the Mac OS has this capability built in, and
>has had it for quite sometime. With Windows 95, I have to download
>the "correct" drivers from Diamond, or install an aftermarket product
>or upgrade Windows 95 to OEMSR2 in order to get it.

You should be able to change resolution without any problems; I'm not sure why you have a problem. That is odd.

>Simply put, the Mac way is more elagent than the Windows 95 way.
>That's all I'm saying.

Based only on your experience, you might have a point. Fortunately, I
don't think that's typical.

CPU level compatibility was promised. It was touted as one of the many
advantages of RISC technology. It never materialized and is now getting
swept under the rug.

Nevermind that Mac PC cards will most certainly cost you more than
an entire new PC.

Quite frankly, you aren't qualified to make that comment.
You don't even have any decent level user experience that
isn't greatly outdated. Furthermore, you've demonstrated
a complete computer illiteracy when it comes to technical
details of any kind.

Fill in the details, if you can.
Things that can be accomplished through applications
(like cyberstudio) don't count.

Furthermore, such 'distinctions' serve no purpose other than
'genetalia' waving.

It need not be modern. It needs to only do what is required
of it and not place uneccesary barriers to that end.

Most of the features that are new and nifty these days are actually
rather old. Most new microcomputer OS features are typically merely
repeating what has been done on the larger systems in the previous
DECADES.

> but for TOS and Atari apps it is plenty fast.

Modern microcomputer OSes have a nasty tendency of 'getting in the way'
in that they eat up a large chunk of the machine they are running on.

The genius of TOS/GEM was that it delivered quite a bit while not bogging the machine down. It is appropriate for a 68000/8. System 6.0 was not and it showed. In a similar fashion, OSes have continued to grow faster than the hardware.

Until the recent drop in RAM prices, most 'modern' microcomputer OSes were painful to use as they would not fit inside the machines they were designed to run on. Innapropriate tactics, designed for highly concurrent, mult-user, high IO bandwidth machines were used. This virtual memory would slow down a Mac or PC to the point where an ST and it's 'primitive' OS could catch up.

ROM was faster than floppy in 1986.
ROM is faster than HD now.

Only a recent memory glut has saved the current crop of 'modern' machines and their OSes from running at the speed of a hard disk (50 times slower than a 68000/8) rather than their full potential.

Try to use one of these modern OSes in twice the memory capacity of an ST and see what happens. Then run the austere yet relatively perky ST next to that 'modern' machine.

I remember an even more recent fiasco by IBM. When Win95 first came out, IBM, unlike all the other major PC vendors, had decided to believe in its own "White Paper" lies that Win3.1/DOS was actually "better" and that Win95 wouldn't sell and no one would want it, etc.

When 1995's fourth quarter selling season began, IBM had, because of that folly, a bunch of Aptivas in the channel pre-loaded with Win3.1/DOS that weren't selling at all; everyone was buying new PCs for Christmas 1995 with Win95. (so much for the dumb uninformed 'sheep' masses that the OS/2 advocates here like so often to refer to).

The end result was that IBM scrambled like mad, according to a Radio Shack executive friend of mine, shipping "Free coupons for Windows 95" to go with every Win3.1/DOS pre-loaded Aptiva, still sitting on shelves and in warehouses.

He told me that he got cases of them to distribute to Radio Shack stores just before Christmas, but that nevertheless, IBM lost a bunch of sales as a result, since the consumer obviously preferred Win95 pre-installed.

According to him, this was the cause for much of the major recent 'bad blood' that ensued between the PC Co. and the OS/2 PSP crowd, which had convinced the PC Co. albeit briefly, that "Win3.1/DOS was better" and that the consumer would reject Windows 95.

>95 supplies built in drivers for the chipset built into my video card,
>why should I need these *extra* drivers when Windows 95 already has a
>supported driver? So, with that said, I guess that I still haven't
>got it.

Some drivers offer extra functionality, as with any OS. The things
we're now discussing are generic to any OS.

>>...as does the PC for VESA modes and for any chipset built into Win95.

>You need the special VESA driver do you not?

This is why you're spreading FUD - you don't know, and then you state,
as if it's fact, that you do need oodles of special drivers. Sigh.

Let me say it again - in the BIOS of cards today, there exists VESA
drivers. In the Win95 OS there exists drivers for many cards found on
the market today. It's that simple. And - also - every OS requires
drivers. Everything. At some level, there's a driver involved.

>>The standard in DOS is VESA, which, as we've been over, is on modern
>>cards.

>But still requires the use of the VESA driver.

You keep repeating that. Every OS requires drivers.

>If you say so. I don't consider something that I have to install to
>be "built in". If you want to call it word play, fine...it's word
>play.

You don't need to install VESA drivers for most cards, and you don't
need to install Win95 for most PCs you buy - although you certainly
can reinstall it, as you can reinstall MacOS, if you wish.

This is going in circles. Both OSs, as with any OS, require drivers.
At some level, they're there.

CPU level compatability with the x86 was never promised by any member of
the main trio which worked on PowerPC (Apple, IBM, Motorola). Apple
promised some degree of 68K compatability through software emulation.

There were plenty of rumors for awhile about a IBM project, the PowerPC
615. It was to be a 2-in-1 CPU combining x86 and PowerPC. You cannot
call it a promise since IBM never announced it, denied most if not all of
the rumors and leaks about it, and finally announced (at least a year ago)
that the project had existed but was canned due to technical problems.

> Nevermind that Mac PC cards will most certainly cost you more than
> an entire new PC.

I agree that this is the case. However, from my perspective as an
engineer, I can easily see why. They will never sell nearly as many of
those boards as a single PC motherboard manufacturer will of its
motherboard design, so the board cost is higher (volume production really
cuts costs a lot). And the system ASIC they have on it to glue everything
together is produced in even less volume relative to ordinary PC chipsets,
since PC chipsets are typically sold to many motherboard companies.

If you are in the market for a PC card, you must basically decide whether
the bad pricing (equivalent to buying an entire PC with the same specs) is
worth the advantages (you can use the same keyboard, monitor, mouse, and
no desk space is taken up by a second machine).

Ever seen BeOS? All sorts of modern features. Faster interface response
than TOS, on the same machine. (I can crank up ten or so instances of a
little 3D rendering demo, causing the CPU usage to peg at 100%, and BeOS
will still maintain instantaneous response to mouse clicks and keyboard
events for the foreground app.)

Uh, yeah. Whatever. VM doesn't cause a performance hit unless you use
enough memory to force it to start swapping pages out to disk. In other
words, it lets you use your computer for more things if you want to. This
has nothing to do with whether an OS is designed to run a huge multi-user
behemoth or your personal computer (indeed, if you want a large compute
server to have decent performance, you must put enough RAM in it so that
it doesn't have to swap often, or else users will complain that the
machine is a slug).

> ROM was faster than floppy in 1986.
> ROM is faster than HD now.

So what's your point? That we should stay mired in the backwaters of
computing just to be absolutely guaranteed that a disk swap operation will
never happen?

You could also just buy one more video card and one more monitor... for
the Mac. They will all work together just fine

On the PC except in a few specific cases, you have to throw away or sell
the old graphics card, get a special video card for handling mulitple
displays and purchase another monitor.

> >to do so. Try that with a PC (without "special drivers").

> More MacVocate hypocrisy in action...

The 'driver' or extension in this case is not to get the computer to work
with the graphics card, but to enable graphics acceleration. Resolution
and bit-depth changing should work just fine without the extension.

Umm... there is a driver API, and there has been access to accelerated 2D
and 3D acceleration for quite some time (perhaps it didn't exist before
the SE and Mac II though... then again, nothing before the SE and Mac II had
any means of expansion outside or RAM and Drive expansion).

It could also be that there is no market for cards that don't support
gamma correction, pan and zooming, and virtual desktops on the Mac.

Because most Macs have graphics built onto the motherboard, the only
reason to buy a graphics card is to get more features, and further for
graphics proffessionals (from which the Mac has a relatively high market
share) such features are needed and they would not consider a card with
fewer features than those mentioned.

With PCI Macs, there is no special hardware needed to support Macs as
long as the card conforms to the latest PCI spec.

>
>Just out of curiosity, what do -you- think that "power" is?

For me, it is memory protection. NT's memory protection is much better than Windows 95's. It also doesn't appear to suffer unexplained problems like Windows 95. I set it up, and have not bothered with it since.

>>Am I? Earlier you told me that I should get OEMSR2 to clear up this

>Win95 they included only the ability to change resolution on the fly,
>and OEM manufacturers could then add features to the basic drivers.
>Any deviation from that norm is unusual.

So this was a flaw in Windows 95, hence the dispute here. Now I have to hunt down SR2 in order to get this functionality. How does installing SR2 differ from finding, and installing the right driver that would have provided this functionality? It doesn't...it is another step the end user has to take which they shouldn't have to.

>>Why do you think that I have a problem? You, yourself told me to get
>>OEMSR2 to gain this additional functionality. Since it was included
>>with OEMSR2, I would imagine that I'm not the only one having
>>problems.
>
>I also said a normal R1 owner of Win95 (release one, August 95) can
>switch resolutions without problems; I don't know why you have them.

Because we're talking PC's and Windows 95 here. This is precisely the point us Mac owners keep saying to PC advocates...Windows is to damn finicky. Things are suppose to work a certain way, but often don't. I don't believe that I'm the only one who has had unxplained problems with a PC and Windows setup. You asked for an example, I gave you an example. Yes, it *should* work a certain way, but it's not...this has been a typical experience with a PC for me. And somehow, I don't believe I'm alone.

>>Also, as I've said in the past, it isn't a problem for me. I don't

It does not negate the Mac point. The fact that you had to supply a fix is exactly the problem. You shouldn't need a fix for something like this...that was my point.

>>What I am saying is, that the Mac OS has this capability built in, and
>>has had it for quite sometime. With Windows 95, I have to download

>>or upgrade Windows 95 to OEMSR2 in order to get it.
>
>You should be able to change resolution without any problems; I'm not
>sure why you have a problem. That is odd.

Your right...I *should* be able to, but I can't. This is not something I'm surprised at. It is not the first time that I *should* be able to do something, but can't with Windows 95. This is the typical behavior that I've come to expect from MS products.

>>Simply put, the Mac way is more elagent than the Windows 95 way.
>>That's all I'm saying.
>
>Based only on your experience, you might have a point. Fortunately, I
>don't think that's typical.

Somehow I think it is typical. I've got nothing against the PC, it works fine for me, and I have no reason to try and bash it. However, I am reporting reality here...and the reality that I've been exposed to has been one of a hit and miss situation.

You don't understand.

With only two exceptions from 8 years ago (on cards/monitors that did not
follow the Macintosh conventions) all graphics cards I know of will work
on a Mac without a driver.

To enable graphics acceleration, an extension would have to be loaded.
A card will work, but it won't be all that fast until you use the
extension (or control panel) to enable the graphics acceleration.

Perhaps it is very similar on PCs, but that's generally how it works on Macs.

>
> Enjoying your life in Oceana?

Perhaps the arguement just boils down to our definitions of driver.

I would consider a driver to be software that enables some bit of
hardware to work such that the user can use it.

As such, the extension for a graphics card on the Mac is not so that a Mac
user can see anything, but so that the Mac user has accelerated graphics.
By the rather simple definition I stated above, this extension is not
really a driver. The extension makes certain graphics calls be performed on
the card rather than the CPU, but is not vital to there being anything
useful on the screen.

Accurate. But when I buy a PC card, it will be a Pentium card, not an
obsolete 486 like Orange Micro sells.

TOS only does so much. This is key to understanding the performance
that TOS compatible apps acheive on the T060. Software heads have the
ability to optimize their applications, not necessarly having to follow
the guide lines that Mac O/S programers must adhear to. Maybe not good
in practice, but how else can you explain the performance that most TOS
applications display on even the modest of Ataris.
As far as the Power PC blowing away the T060, you should really pick up
the latest issue of Current Notes.
I can't speak for all T060 users and wantabees, but I see a hardware
platform with much more potential and versatility than what is offered
by Apple or Intel at a substantial lower overall cost. Just add a
quality video card to an 8500 and you have far exceeded the cost of
the T060.
Concerning legacy Atari software, the only problems I have with
the availability of "new" applications is being able to afford
to purchase them at the rate they become available.

Sorry Tim, my crystal ball says Apple won't be around that long without
major reorganization. The real question will be if the clone

manufactures
are willing to invest in what Apple has purchased. This is of course my
own opinion, but Apple's performance in the market does indicate
problems
on the horizon. Time will tell.

Mike

Apple isn't alone in announcing vaporware. In fact, I can't think of ANY PC
or software hosue that hasn't done it at least once.

> Nevermind that Mac PC cards will most certainly cost you more than
> an entire new PC.

True, however... You won't need a second keyboard, second monitor, printer
switchbox, and so on. OTOH, plan on at least tripling the size of the hard
drive; MickeySlop is even more inefficient than Mac System.

No, I'm running it on my PowerMac 7500 (upgraded to 155 MHz 604). TOS run
through the services of a MagiCMac demo. BeOS DR8.2 for PowerMac.

> If you are refering to a Be Box,

On a BeBox, of course, the BeOS would try to balance the load between each
CPU. DR9 of BeOS will support multiprocessing on the Mac, but I don't
plan on getting a multiprocessor card any time soon.

No, it's because the MacOS has one of the crappiest VM implementations in
the known universe.

Still, if you are careful to keep the memory consumption of all your
programs beneath the size of total physical RAM in your machine, you
should not ever see a bad VM hit.

>How can you consider ROM based operating systems to be " mired in the
>backwaters
>of computing"?

Take the phrase to mean "stuck with an OS that doesn't support VM". As
far as I'm concerned, an OS without VM and memory protection is fairly
backwards (which is one of the two big problems with the current MacOS).
Every personal computer CPU from the 68030 and 386 onward has had the
hardware to support it.

> You sound smarter than that. Almost all embedded systems
>used in
>industry utilize a ROM based operating systems. It is more efficient.
>When was
>the last time you had to boot your 5 axis CNC mill from floppy or hard
>disk?

Embedded systems are an entirely different thing. (I've designed and
built an embedded computer based on the 68HC11 microcontroller, so I do
know whereof I speak.) Your typical 5 axis CNC mill is not an ideal
environment for magnetic media. Reliability is more important than the
ability to change programs on a whim. Programs tend to be small, and
operating systems (if they exist at all) do not usually need to offer
services like VM. So it's entirely practical to put most things in ROM,
and use some form of solid-state memory for dynamic storage (like flash
memory).

The MacOS of 9 years ago isn't modern either, you have no idea about
the modern Atari operating systems. You expect us to believe all you
tell us about your vapourware OSs but if we mention a quality OS that
has existed for years on the Atari you brand it to be rubbish when you
haven't seen it. An OS that exists is better than one that doesn't, no
argument no matter how badly to you try to make one. Anyway why does
the Mac need so many OSs, quite a few months ago according to you MacOS
was fantastic, then Copland was going to be the next best thing, then
it was going to intergrate BeOS to make it better now it's NeXT being
mixed in, it would appear that any OS on this earth, even in your
stunted views is better than MacOS and as yet of the 3 I mentioned 2
aren't going ahead and the other is but a distant dream.

>> If you are going to be an ass and close minded about it, why should I

>
>Why do you? Sounds like you are defending..

I'm sure "Sounds like you are defending.." is some sort of bait to be
snapped up and responded to to in your mind but to me it makes no
sense. It's just stating the obvious, you launch your usual
unreasoned, uneducated attack on the Atari machines and you state that
he is defending like it's something weird or to be ashamed of. I have
no idea what you are getting at.

>> An 060 may be too slow for MacOS, hell, a PPC is too slow for MacOS,
>> but for TOS and Atari apps it is plenty fast.
>

No it's exactly the same, this just goes to show that you don't know
anything about the Atari platform atall, the sentence you quoted
doesn't appear to suggest what you assumed in any way.

>>
>> Price is all relative. perhaps this machine is worth more to a certain market than a slower 1500.00 PowerMac is?
>
>I suppose. Must to be the ones with deep pockets.

It's not cheap. Good computers AREN'T cheap.

> I highly doubt will be a sustainable..

You did what?

>Considering the PowerMac hardware platform doesn't sit stil.

It couldn't, it would sink without trace if it did.

>Soon MP boxes in the same price range as what you sell plus running the Be OS,
>Tempus and Rhasopy..

Tempus? So what you are saying is that soon there will be good
machines available but they won't be running the MacOS and these
finally WILL be good, sounds about right. And Rhasopy is a very, very
stupid name for an OS don't ya' think?

Oh? Describe is in trouble for its mismanagment, Smartsuite/2 only
came out with half OS/2 native and none of the previous Lotus products
are on the level to compete with other OS/2 products. IBM's own
DB2, long ported to OS/2 before Lotus was in IBM's eye, and even
more strategic to IBM than Notes with much more backing behind it, never
stopped OS/2 from getting a lot of database products as well, such as
Oracle. Tell me how Notes competes against Galactic Civilizations and
Deskman/2 for instance.

Their drivers offer more than resolution/color changes. It gives you
better performance as well as "virutal" desktop--at least when you
install their OnControl utility (which is part of their driver
distribution). The OnControl will allow you to change desktop size
along with resolution on the fly. It also adds the Start menu to the
left button clicked on any open desktop space--kind like what X does.

It's worth the 1.2MB bandwidth it takes up (this is the version for my
wife's 3200 XL card--yours may be larger/smaller).

You must be joking! I was reading a Win95 newsgroup a few weeks ago,
and some Teamster popped in and said something like, "You people are
having so many problems. If you want a problem-free OS, try OS/2
Warp!". Just out of curiousity (and having had many problems with OS/2
Warp in the past), I subscribed to an OS/2 *.setup newsgroup, and it had
all kinds of big problems being grieved. "Blue screens of death in
Merlin" was a big thread, people were complaining about frequent traps,
freezes, how much slower Merlin was than Warp 3.0, hardware
incompatibilities, etc. As a matter of fact, considering the ratio of
people using Win95 vs those using Warp, it seemed rather apparent that
there were probably more problems per user in OS/2 than in Win95.

This is a very good point. One that I wish the frequent Mac advocates
here would consider before bashing the cost of a Direct T060. The
limited
production of these machines is the driving force of the "touted" high
price tag. Even then, "major apps" aside, the Direct T060 (Hades) is
at a performance advantage over even the fastest of Mac's because of
the TOS operating system utilized. For most users of the 060 clones,
this is the driving factor behind their purchase, major apps aside.
The Atari user that requires features such as built in ethernet has
probably already purchased a Mac as it has been a standard feature
for quite a few years. For the home Atari user, the ability to
utilize a DTE rate of 230kb has been available for quite a few
years. The talk of Apple adopting a major alternate O/S has been
going around for quite some time. Maybe it will happen. There are
several alternate O/S's for TOS based users to choose from. Many
already have supporting applications that are readily available for
download, generally freeware or at a modest price. No need to see
what the Be O/S might offer the PPC user. One thing is for sure,
you probably won't be upgrading a Claris or Adobe product for
a Be O/S replacement app. Most TOS apps function equally well
under any of the available O/S's, something TOS users have under
stood for quite some time. The T060 is a new beginning for the TOS
platform. The expensive proprosition of upgrading a Falcon to a
040 CPU becomes an inviting alternative when what you stated above
is taken into consideration concerning limited production and pricing.

Yep, but for now all you have are demos. You don't mention what machine
your
are running the Be O/S on. Same machine? Are you saying that there is a
port
of the Be O/S for TOS based machines? If you are refering to a Be Box,
then
why wouldn't the second CPU be available while the other is pegged at
"100%".
I would hope that this is what the machine was designed for. My god,
could you
image a dual processor T060 running two copies of MagiC at the same time
in
two different windows on the same 21" screen. It boggles the mind.

>
> Uh, yeah. Whatever. VM doesn't cause a performance hit unless you use

How can you consider ROM based operating systems to be " mired in the backwaters
of computing"? You sound smarter than that. Almost all embedded systems used in
industry utilize a ROM based operating systems. It is more efficient. When was
the last time you had to boot your 5 axis CNC mill from floppy or hard disk?

Bwagh haa haa haa. Peter, you really are a dork. You are comparing TOS 1.0 from 9 years ago to the likes of TOS 4.04, MagiC 5 and Geneva which are operating systems used on Ataris today. Why, going on that i can say that MACOS doesn't have any colour at all and still uses small 12 inch screens... why, I might even go as far as saying that PCs use something called MS-DOS 3.xx and no window environment.. hey... I can even say that Unix doesn't have a woindowed environment!

GET REAL Peter!!!

I would have to disagree. The driving factor is that people who buy one
must really have an attachment to legacy Atari software that needs to run
as fast as possible. Sure, TOS responds (relatively) quickly, but the OS
only does so much. When it comes down to how fast your computer does
compute-intensive tasks, a PowerPC is going to blow away the 060.

>The talk of Apple adopting a major alternate O/S has been
>going around for quite some time. Maybe it will happen.

Haven't you heard? Apple bought out NeXT. The NeXT generation Mac OS
will be NeXTStep. (Sorry, couldn't resist the obvious pun.) They plan to
keep releasing System 7.x updates for a couple years, but the new OS based
on NeXTStep will be the flagship OS. Apparently they plan to release the
first version in about 1 year, which is actually realistic since it's a
complete OS already and they've got the entire NeXT development team.

You should see Tempus scroll on a T60, that is I mean, you should try
and see Tempus scroll!

The Apps I refer to are Calamus SL96, DA's Layout TC v6, Photoline,
DA's Repro, faster than comparable feature wise Mac or Win apps.

The T60 is quite likely the fastest "System" on the block.

I say "System" because there is little doubt that there is faster
hardware, but that hardware is bottlenecked by inefficient programming.

All the best,
Chris @ Computer Direct

I have to disagree with you here, only because we sell the machine
and have sold it as well DTP software to major pre-press houses.

The T60 with Calamus SL or DA's Layout outperforms any PPC or Pentium
in it's price range.

You would really have to experience it to understand it. Words cannot
describe the performance levels attainable.

>Haven't you heard? Apple bought out NeXT. The NeXT generation Mac OS

This is probably the best news for Mac owners, but it is much further
than 1 year away... Sometime in 1998 is the ETA and as we all know from
experience, this may likely be delayed. By then I believe MS WinNT will
have made such a dent into the pre-press market that NexT/Mac OS may
be too late.

I sincerly hope that this does not happen though.

All the best,
Chris @ Computer Direct

If you haven't yet reached that point then you aren't really using
the virtual memory now, ARE YOU? You could just as easily turn the
toy off. However, if you were to actually actively use any non-trivial
amount of VM, Mac's and PC's are crippled.

Virtual memory was developed in one context and then applied to another.
This is a simple matter of computing history and architecture for those
who know and understand the issues involved.

>words, it lets you use your computer for more things if you want to. This
>has nothing to do with whether an OS is designed to run a huge multi-user
>behemoth or your personal computer (indeed, if you want a large compute

Actually, it does. The disk and the bus it is attached to has to
be up to the challenge. Otherwise, your machine takes a HUGE performance
hit should it ever decide to use that nifty virtual memory. This is
quite easy to demonstrate with a microcomputer.

>server to have decent performance, you must put enough RAM in it so that

So? How is TOS a backwater? One has yet to address that. All you
MacVocates can come up with are application level toys.

However, since Petey-Boy himself seems to think that the OS is just
a pathway to the apps, then great OS sophistication really isn't
required. There is little that MacOS or Win95 has that cannot be
grafted upon TOS at the applications level. Most of what they have
are bells and whistles.

Software should be designed to run on the hardware of today, no 4
years in the future. While petty justifications for braggadocio are
nice and all, computers are tools in the end. They either do the task
you desire in a satisfactory fashion, or they do not. Beyond childish
rhetoric, you have said nothing. How does TOS limit the user? Which
of these limits is not addressed by MagiC 4.0?

It might not be all that complicated, but that is still not plug and play.

Actually, I was refering to being limited on the Mac. I have never seen a
Mac with all its expansion slots filled (well, except those that were
pizzabox style Macs).

> >My roommate has a PC that has one PCI slot left. He has added nothing to

He has a total of 3PCI and 3ISA (one is a shared PCI/ISA slot that makes
for 5 slots if I have his configuration right).

> >PCI Macs OTOH have at least 3 free PCI slots. Those with 6 PCI slots

Taking up two of his PCI slots, he has a graphics card and a SCSI card. This was how the machine was shipped.

Taking up two of his ISA slots, he has a sound card and a modem card. This is how the machine was shipped.

He has one free PCI/ISA slot that (according to him) can be used either as a PCI slot or an ISA slot, but not both at the same time... though perhaps I misunderstood him or perhaps he is mistaken.

In any event he has little expansion left whereas Macs come with at least 3 PCI slots free. Things like SCSI(and/or EIDE), graphics and sound are on the motherboard and don't take up any slots.

Yes, but the 'investment' in the original card and monitor is not
lost on the Mac. The old card and the old monitor will work just fine
with the new ones so you aren't forced to sell anything or thow anything
away (unless of course you want to... you have the choice).

Maybe you keep the old monitor (as long as you purchase the appropriate
card to use both the new and old monitors), but the other graphics card is
either going to be scrap or it will be sold at a price much lower than
its initial cost with a PC.

Huh? I still don't see why the choices made by the Intel based PC
industry and its OS makers can be made to be virtuous because it was
really hard to impliment (and not implimented terribly well at that).

It certainly may have been an amazing feat, but I doubt it was healthy
for the industry. It is certainly not something for the PC industry or
its advocates to brag over.

"We made some terrible choices a short while back, but we stuck with them
and through a lot of pain and effort at your cost, managed to get it all to
work... sort of. Isn't that great?"
-The PC Industry

Apple's 'feat' may not have taken nearly so much effort, but it was
certainly a better choice. To praise PCs for having people go through
more effort for worse results is silly.

Thus we can reasonably assume you consider the various kludges from Redmond
to be "backwards?" One of the iggest causes of GPFs (or whatever Win95
calls it now) has always been memory "protection" that didn't.

I see. That's a good reason. Why not run MacOS at home? You seem to prefer it. ... of course, MacOS is far _less_ stable then Win95, and has no comparison to WinNT.

>So this was a flaw in Windows 95, hence the dispute here. Now I have

It wasn't included in Win95. I think calling an exclusion a flaw is reaching.

>another step the end user has to take which they shouldn't have to.

In that I would have liked it to be standardized for everyone in Win95 without any work, sure, you've got a point. Now tell me about Open Transport 1.1.1 and getting CoolTalk working with Netscape 3.0? Talk about going through hell! Downloading updates is, unfortunately, all too common with a PC - or Mac.

>It does not negate the Mac point. The fact that you had to supply a
>fix is exactly the problem. You shouldn't need a fix for something
>like this...that was my point.

Great. I shouldn't need a fix (QT2.5, OT1.1.1, AG2.02) in order to get CoolTalk working in Netscape 3.0 on a Mac. Yet I do. And instead of downloading a 50k graphics driver update, I've got to download a 2 meg QuickTime upgrade, a ***TEN*** megabyte Open Transport upgrade (1.1.2), and a God-knows how big AppleGuide upgrade. God save me if I didn't have a good net connection! On the PC, getting CoolTalk working simply involved downloading Navigator 3.0 - that's it, NOTHING else. It was a breeze. I'm _still_ trying to talk my mother through the Mac installation. Strange...I thought Macs were so easy to use. And OT1.1.1 for some reason comes in disk images, and she's got no clue how to install from them, so I'm left guessing what she's trying

to do. It's one long and nearly endless mess, just to get a dead
simple CoolTalk application working on a damn Mac.

8*24SC (GC?) being one; what was the other?

Straight from Apple, that was their "high performance" card for the
longest time. It didn't work under System 7, I think it was.

>To enable graphics acceleration, an extension would have to be loaded.
>A card will work, but it won't be all that fast until you use the

Sounds a lot like Win95, actually.

>Perhaps it is very similar on PCs, but that's generally how it works on Macs.

Yep.

>I would consider a driver to be software that enables some bit of
>hardware to work such that the user can use it.

By that definition, Win95 doesn't require any drivers for much of
anything by the most extreme definition, and requires drivers for
everything by the most modest definition.

>there were probably more problems per user in OS/2 than in Win95.

Hmm. Don't know about Merlin yet. Haven't gone to it. Warp is
stable and good for me. But there could be a whole slew of other
reasons. Let me punt this one out:

Perhaps OS/2 users are more connected than Win95 people, i.e. they are
more likely to subscribe to newsgroups than a Win95 user.

I'm not saying you're wrong but unless you factor in other things,
putting out "considering the ratio of people using Win95 vs those
using Warp" etc. as a sole reason leaves a lot of causes to be
examined.

Food for thought, dig in.

Spend as much as you would for the equivalent Mac PC card on all
of that, plus the PC itself and you would still come out ahead.
Mac PC cards are THAT overpriced. For a secondary system, 500M
would do. If you need more than that, then you likely need a PC
a little less obsolete (card or whole PC).

Orange Micro is selling discontinued PC technology at premium prices.

Virtual memory has been given much more hype than it deserves.
While sitting on the other side of the fence it seemed like a
good and rather nifty idea. However, after actually using
micro systems that were dependent upon virtual memory, I found
it to be more of a curse, actually. It encourages and allows
developers to work outside the common hardware constraints. The
end result is performance that can deteriorate past the point of

a 8Mhz MC68000.

Fortunately, memory prices have dropped to the point where buying
adequate hardware (memory) for the software is a practical option.

VM as a memory management tool has some merit. VM as a replacement
for adequate physical memory is more backwards than any TOS or GEOS.
It's cripples the 'modern' machines that have, until relatively
recently, been dependent upon it [VM].

I wouldn't be surprised if core memory were faster...

Actually, if you saw a GPF notice, then protection was working.
Now, if on the other hand, it just mysteriously crashed: that
would be a protection failure.

Although the (pragmatic) need to restart Win at that point is rather
contrary to the whole point of memory protection however...

At least in the case of System 7, all it really depended on was you not
running much extra crap. 4 MB is enough to run one or two programs at a
time on a 68K Mac with System 7.1, without VM. 7.5 increased memory usage
somewhat, but by the time it was released, memory was cheap enough that
lots of people were going to 8 MB or more.

Hype? Nah. It's just an essential part of running a computer. If for no
other reason than that implementing VM usually gives OS designers a
straight path right into memory protection (or vice versa).

> While sitting on the other side of the fence it seemed like a

Surprise, surprise. If you really beat that VM system hard, it'll thrash
and you lose all your performance. In my experience, there are usually
ways to avoid it.

Neither would I, at least in terms of access time (core is random access). Interface speed may or may not give disks an edge in throughput; I have no idea how core is interfaced to.

I've never said that VM is a replacement for adequate physical memory. Indeed, I seem to recall pointing out that on large multiuser machines the worst thing in the world is to have inadequate physical memory. However, I find VM an essential tool to have present. For example, if you have a computer with 16MB physical RAM, 99% of it already in use, and need to open just one more app, VM will let you do it with a slight performance hit (mostly seen on startup of the app).

>>Every personal computer CPU from the 68030 and 386 onward has had the
>>hardware to support it.
>
> The entire computer doesn't have to be on the cpu's die you know...

Of course not. The point was that from those CPUs onward, you didn't have to pay extra for a second chip to do it. (Actually, in the case of the x86, there has never been an external MMU. And in the 680x0 series, only the 68020 had the ability to interface to an external MMU.)

>>should not ever see a bad VM hit.

Virtual memory is not the real issue here that slows down MacOS and
makes extremely powerful hardware seem slow.

Virtual memory on any platform is obviously not as fast as real RAM.

Uwe Seimet's implementation of VM is probably the fastest and most
intelligent of any. A reasonable swap partition with Outside does not
suffer much in the way of noticeable performance hit.

The real issue here is that disk based OS' like Win and Mac spend so
much time accessing the hard drive for simple procedures that we take
for granted with smaller RAM or ROM based OS' like TOS and the other
replacement OS' available to Atari users.

An example I use often, open a folder that contains many files such as
a CD ROM and watch MacOS on a PPC slowly draw the contents of that
window.

This is the real bottleneck in disk based OS'. They access the hit the
hard drive so often that performance is noticeably hindered.

Applications on TOS computers execute faster, occupy less physical
memory and are highly optimized.

The main reason for this is simple. Atari developers are not large
corporations. large corporatiions are more concerned about getting
their products onto the shelf. Hence, they program in high level
languages and spend very little time optimizing the software.

Atari programmers on the other hand, do it for the love of the machine
and enjoy the satisfaction of achieving great things from small code.
Many Atari programmers work in machine assembly code, a corporate no-no
in the Mac and PC market.

All the best,
Chris @ Computer Direct

Virtual memory is not the real issue here that slows down MacOS and
makes extremely powerful hardware seem slow.

Virtual memory on any platform is obviously not as fast as real RAM.

Uwe Seimet's implementation of VM is probably the fastest and most
intelligent of any. A reasonable swap partition with Outside does not
suffer much in the way of noticeable performance hit.

The real issue here is that disk based OS' like Win and Mac spend so
much time accessing the hard drive for simple procedures that we take
for granted with smaller RAM or ROM based OS' like TOS and the other
replacement OS' available to Atari users.

An example I use often, open a folder that contains many files such as
a CD ROM and watch MacOS on a PPC slowly draw the contents of that
window.

This is the real bottleneck in disk based OS'. They access the hit the
hard drive so often that performance is noticeably hindered.

Applications on TOS computers execute faster, occupy less physical
memory and are highly optimized.

The main reason for this is simple. Atari developers are not large
corporations. large corporatiions are more concerned about getting
their products onto the shelf. Hence, they program in high level
languages and spend very little time optimizing the software.

Virtual memory should not slow down the machine. I am running a Linux box and although I used to have 16MB of memory, I required much more to compile my programs - about another 16MB in fact. Without VM this wouldn't be possible. When I compiled, my hard disk thrashed itself to pieces, but at least things worked (albeit quite slowly).

Now I have 32MB and compilation times are far better as there is enough memory that programs can proceed a reasonable distance before having to load in a bit more.

However it is not the case that you need more real memory than you have processes running. In Linux although I have alot of processes "running", quite a few only wake up now and again. These can be swapped to disk to free physical memory. For instance all the gettys on my machine (which I log in on) are swapped out to disk.

ATM for instance over 3MB of physical memory is being saved:
```
total used free shared buffers cached
Mem: 31252 29144 2108 10700 2452 15624
-/+ buffers: 11068 20184
Swap: 48888 3372 45516
```

Some OSes (probably experimental ones) try and work out how much memory each program will need in order to proceed at a reasonable rate. If the total of these requirements is greater than the physical memory, then it pauses one of them for a while and swaps it to disk so that the other processes can have the amount of memory they require.

Virtual memory is not too difficult to implement and since memory protection normally works well with it, there is no reason to disable it.

Linux uses a huge amount of memory for caching (as you can see) and varies the size of this cache dynamically. When I was compiling, I used to have very little cache left as Linux thought it would be faster to use the memory for actual processes. Now I have 32MB, it still has a sizeable amount of cache.

As for GPFs in Windows, well the memory protection doesn't work. If it did then you wouldn't have to reboot. At the very least something in the critical parts of the system are getting corrupted when they shouldn't. I have never written a program which has crashed my Linux box - this is why developing on a Unix box is so nice compared to windows when you might have to reboot several times an hour!

Well I was not so lucky. Every time the machine booted, for any reason, ckdisk would run sending the server into a LONG (like 2 hour) period of no-response which was impossible to stop. No indication of _what_ was happening either, not even Performance Monitor would show anything other than that the disk was being thrashed, apparently for no reason.

Worse the system would publish itself on the net, but take effectively two hours to respond to your requests. So if you logged in from the Chooser, your Mac locked up. Fun stuff.

Two hours, and the sad part was this was for a 2gig drive. Sigh. I ended up finding a fix, replace the ckdisk (do I have the name right? I don't think so) with an empty text file to "fool" NT into doing nothing. How utterly advanced.

Maury

>Virtual memory should not slow down the machine.

Bullcrap. If you can find a hard drive that has 60ns access time, and costs less than the National Debt, I'll agree with you. Until then, VM can't be as fast as real memory and therefor MUST slow down the computer - it's a physical reality like gravity. FAST hard drives typically have 9 ms access time - 1000 times slower, more-or-less, than RAM. And transfer rates are typically on the order of 1 to 3 megabytes per second, versus RAM transfers of 2000 megabytes per second on a 33 MHz memory bus.

VM slows down computers. QED. That's why our servers (in the software lab here) typically run between 256 and 512 megabytes of RAM with VM turned off.

What are you talking about? All virtually memory does is swap pages of
memory out to disk when you don't have enough real RAM, so what you
are saying about it not slowing the machine down unless you actually
use it is obviously true but you are stating the complete bloody
obvious.

Having the OS in ROM has little to do with disk swaps.

Many graphics cards I known of on the PC will work without a
driver either. The reason is called the VESA video BIOS.

The VESA video BIOS is a standard for controlling the video mode and
accessing the frame buffer + certain acceleration features (VESA2.0) on
the PC.

DOS program (games) tend to use this because they have no other choice.
OS/2 has a generic driver that can use it as well. I believe that Win'95
and maybe NT also have generic drivers that use the VESA interface. (I
could be wrong.) Linux definately does. (Unaccelerated X-Server)

This is a total waste of the card's acceleration features however.

>To enable graphics acceleration, an extension would have to be loaded.
>A card will work, but it won't be all that fast until you use the

Aha. Driver.

>Perhaps it is very similar on PCs, but that's generally how it works on Macs.

A frame buffer (IE a card without acceleration features available) would
get KILLED on the Windows market today.

Unless the card was very cheap, say $25, NO ONE would use it because it
would be insanely slow compared to even cheap accelerated cards.

>really a driver. The extension makes certain graphics calls be performed on
>the card rather than the CPU, but is not vital to there being anything
>useful on the screen.

A driver, by my definition (maybe not yours), is any piece of software
that isn't part of the OS kernel, which communicates with a piece of
hardware directly and presents an abstracted standard programming
interface to the rest of the OS and/or user programs.

An extension which enables acceleration:
1. Is a piece of software that isn't part of the Mac OS Kernel.
2. Communicates with the hardware directly.
3. Enables acceleration by extending QuickDraw
(a abstracted, standardized programming interface to the rest
of the OS).

Therefore, I consider that this type of extension *is* a driver.

Yup... Just go to your local garage clone dealer and get a new
drive mechanism. If the drive manuf. is different from your old
one (such as epson) you might have to cut up your old case a bit
however.

Just tell the garage clone dealer to make sure the drive is set
up as drive a. At that point, you should just be able to plug
it into the old connections in the 1040 and have it work.

The drive mech should be no more than 50 bux.

On a slightly different note...
Has anyone ever attempted to use a floppy tape
drive on any of the Atari's?

Typical MacVocate hypocrisy. It matters not that the process would
be identical; ours still is but, yours is not.

Just plug in the card.
No further hardware configuration is required.
If Win is running the standard driver already,
no software configuration is required.
(the standard VGA driver IS the default btw)

They appear much the same and you've done nothing to differentiate
them. Since it has been stated by that firewire developer that the
core video standard is a dumb frame buffer, the two are quite
equivalent. Although VGA++ is a bit nicer than VGA, one is no more,
or less, plug & play than the other.

You just don't like that this makes your precious a bit less impressive.

(I'm still curious as to how well Diamond can foul up a Mac. <bfeg>)

The same is true of PC cards. In Windows default state, you can
interchange any VGA card with any other VGA card without the
need for configuring hardware or software.

If you want to fully utilize the card, activate an 'extension'.

Both machines are identical in this respect.

>
>To enable graphics acceleration, an extension would have to be loaded.

extension, driver... both are extra software that the user must
have in place to enable the full potential of the hardware. Calling
a driver an extension wont make it any less of a driver.

>
>Perhaps it is very similar on PCs, but that's generally how it works on Macs.

Almost identical, actually.

Windows does not require an 'extension' to use a video card.
It is a standard delivered component of the OS. There is also
a version on the system ROM. The ROM is likely where the standard
Mac video driver resides.

>
>As such, the extension for a graphics card on the Mac is not so that a Mac

Then Windows has video 'extensions' as well.

Software optimization techniques are universal. The biggest gains are
gotten by changing algorithms. The next biggest are by techniques like
tight assembly coding, loop unrolling, software pipelining, etc. These
are all OS-neutral.

> Maybe not good
>in practice, but how else can you explain the performance that most TOS
>applications display on even the modest of Ataris.

Such as?

I propose a simple test. JPEG decoding is a pretty well known CPU
intensive operation. Pick a JPEG image I can download and we'll both time
how long it takes to decode it. I'll use GraphicConverter, a well known
Mac shareware app. Just for good measure, I could run the same test using
xv under Linux / X, and maybe even under BeOS if I can find an image
viewer (I think they supply one with BeOS but I'm not sure). You can do
the same, and we'll compare results.

I don't even pretend that I think it's a fair test.

>As far as the Power PC blowing away the T060, you should really pick up
>the latest issue of Current Notes.

What's it got to say? As I recall, that's a print magazine, and it's not
exactly commonly available, so it's a bit much to ask me to just pick it
up. :)

>I can't speak for all T060 users and wantabees, but I see a hardware
>platform with much more potential and versatility than what is offered
>by Apple or Intel at a substantial lower overall cost. Just add a

>quality video card to an 8500 and you have far exceeded the cost of
>the T060.

The 8500 has quality video built in. The reason that video cards for Macs tend to be quite expensive is that there really isn't much of a market for low-end and midrange cards.

Last I heard, a T060 costs well over $2000. $2000 buys you 200+ MHz machines these days, either Wintel or Macintosh.

>Concerning legacy Atari software, the only problems I have with
>the availability of "new" applications is being able to afford
>to purchase them at the rate they become available.

Just out of curiousity, what is that rate? I haven't followed Atari since I got out of it a few years ago. At that time the rate of new software development was really beginning to dive.

>Sorry Tim, my crystal ball says Apple won't be around that long without
>major reorganization.

Sorry Mike, my crystal ball says yours is wrong. :)

Not because I have incredible faith in Apple, though. I think they are on the brink of disaster. But if death comes to Apple, it will likely be a long and malingering death. Consider how long Atari lasted with essentially no sales except to fanatical followers (hell, I almost bought a Falcon, before I realized that a Quadra was more cost effective). Consider that Apple has a lot more market share than Atari ever had. Consider that they have over a billion dollars in the bank with which to absorb losses. (If nothing else, it would take a lot longer than a year to kill off that much money.)

The major reorganization already happened. It's now time to see what the results of that reorganization are.

> The real question will be if the clone
>manufactures
>are willing to invest in what Apple has purchased. This is of course my
>own opinion, but Apple's performance in the market does indicate
>problems
>on the horizon. Time will tell.

Problems on the horizon? They're hip deep in them now. The years of ineffective management of crucial development programs and abysmal marketing of the really cool technologies Apple has come up with have directly resulted in Apple's current woes.

If Apple's NeXT OS doesn't come out on schedule, they will be in a lot of trouble. The old Apple kept pushing Copland's release date farther back, but the new Apple cannot afford to delay "MacStep" (for lack of a better name) even once.

I am really disappointed. When I jumped ship to Apple, it looked like they were a very solid last bastion of non-Wintel computing. But they have since crumbled.

BTW, on a totally unrelated question: Have you ever used the Atari text editor Sudden View? If so, have you ever gotten it to work on MagiCMac? I wanted to play with it the other day, but although it appears to run, it refuses to recognize my password (SV requires password entry every time you run it). For some time I've been interested in trying to write something similar for the Mac, since SV is very cool, but I need it to play with so I can reacquaint myself with the details of how it works.

My PowerMac. OK, it's not precisely TOS, it's MagiCMac that runs on the
same machine.

True. I perhaps cut too much of the context out of my quote.

> problems
> on the horizon. Time will tell.

Are you kidding? PowerComputing is on a roll. Power reportedly sold over
200,000 units in 1996. Not bad for a two year upstart. I bet that their
revenues are at least $500 million. I would suspect that they will break a
billion this year. And yes they are very profitable. Motorola shipped 40,000
units from late Nov-Dec period of last year. I suspect that they will do even
better. Power is the next Dell/GateWay

Apple should make Claris public, a $250 million software firm. Just offer upto
50% of the company to the public and rake in the cash.

Claris, Power, Motorola and Umax could handle the OS as a consortium if
something happens to Apple.

The Mac OS has evolved over nine years from System 1.0 to 7.6 with lots of the latest and greatest..

Next July will see Tempus and by Jan the first incarnation of Rhasopy with lots of good internet stuff.

Maybe so on your platform. Here in Mac land, $1599 buys an APS M-Power 603e200. 200mhz PPC 603e, 1.2GIG, 10X CD, 16 Megs/256K L2 cache and keyboard/mouse.

> stupid name for an OS don't ya' think?

Tempus is System 7.7 and will be out in July. Tempus consists of the finished Copland components. Will have a native finder with multithreaded and the new 3d appearance manager..Thats my upgrade.

Rhasopy has some class and at first I did not know why they settled on that name until I found out the meaning.

Hi,

Is there a "find file" program similar to that on a Mac for the ST which
will search mounted volumes for the selected file, show you the path to
the file and/or allow you to run (access) the file from there.
Navigating and searching multiple mounted volumes get tedious.

233. Defragment HD? Virus Software for HD?

Newsgroup: comp.sys.atari.advocacy

According to the latest issue of Current Notes, the '060 equipped Atari
compares -very- favorably with (approx.) 150 mhz thru 200 mhz PowerPC's.

Yep. Solely because of the Finder's methods for getting the icons for the
files. The benefit of that approach is that every file can have its own
icon, and you never have to (as a user) assign icons to file types.

>Atari programmers on the other hand, do it for the love of the machine
>and enjoy the satisfaction of achieving great things from small code.

That's a bigoted attitude to take. You really think all non-Atari
programmers are corporate automatons? I can assure you that if you look,
there are plenty of lean&mean programs for any platform, written by people
who do enjoy the satisfaction of code bumming.

>Many Atari programmers work in machine assembly code, a corporate no-no
>in the Mac and PC market.

Assembly is hardly a "corporate no-no". There are tons of commercial
programs which use it.

Writing programs entirely in assembly is out, though. There's no purpose
in it, no matter what the assembly fanatics tell you. There are classic
rules of thumb for writing good code; one of them is that your program
will spend 90% of its CPU time in 10% of the code. Speeding up that 10%
with assembly is very desirable. The rest of the program? If you rewrite
it entirely in assembly you will achieve *very* little benefit.

Correction, 3 to 4 times a week.

>For _what_ exactly?<

You name it.
I lose keyboard control quite a bit, only way to get it back is to reboot.
I get the system is busy blue screen all the time, for many programs
System and program settings change for no reason.

Those are a few of the more common ones on my machine, I administer four
other machines in the office, peer networked. All of which have Pentiums
and 16 Mb of RAM or better and there all still sluggish.

One of them stopped asking for a user name and password when you first boot
up, then you have to shut down and log on as a different user to get on to
the network. Compaq has been no help MS support is stumped. Windows
magazines Fred Langa was sumped. It seems I spend more time troubleshooting

Windoze than actually getting any work done.

What's really funny is Win95 is better than it's predecessors. I used and swore by Wintel machines for ten years, then I used my first Mac at a computer store, after 20 minutes I finally realized what a computer can be. I'll never go back.
==========

Chris,

since you used HTML on your MS News to write about how bad Microsoft products are, I am replying to this with HTML too. Some (most) will not be able to see this properly, but I know that you will, unless of course you decide to read it at home on your superior Mac. :-)

What you describe is going on with your Windows 95 set-up is totally abnormal, and you know it. But, this is an advocacy group, and not the proper place to solve your technical problems.

However, since you know that the majority of us who use Win95/NT on a daily basis and set-up similar systems in businesses every day for a living do not have these same problems that you describe, on a routine basis, something is obviously wrong with your set-up and the competence of the computer support staff in your shop.

To blame Microsoft and Windows for this is shortsighted and stupid.

P.S. Hey at least Ross Perot got his money out in cash from an investment that was going nowhere (NeXT). You notice that he didn't take any Apple stock. It's interesting how a company that's losing money by the ton itself, buys for $400 million another dud, to help Ross out. Don't you think that someone should investigate this?

Yes, at VGA. No larger screens, no panning etc. Many of these features
are in QuickDraw so you don't need any other driver to support them.

> A driver, by my definition (maybe not yours), is any piece of software

Well put, but that is that is also part of the API for application
services? For instance, what if the menu system was the video driver?
Odd example I know...

Defrag: best available is Diamond Edge (it also has the facilities to back up your SCSI partition tables and scan the drives for errors, with automatic correction). Contact Oregon Research for the latest version.

UVK (Richard Karsmaker, I believe) is the best virus detection/removal system for the ST. A freeware virus killer is called "Virus Killer" (creative, eh?) and will detect and remove most floppy boot sector viruses.

I don't have immediate contact information for either of these folx, but OR is available through Long Distance information - they're in Tigard, Oregon, area code 503.

Twenty images in 26 seconds? Where the waiting? :)
This will be true for a single image as well.
(We could use the 6 remaining seconds as a "point spread" :)

Ram disk if fine fine here. Is 20mb/sec to fast? Hell, can I just blit
the
image to another area and display it? Would that be cheating?

>
> (Funny thing is, I just realized my challenge won't prove anything one way

Actually (depending which server post my mail first) I just wanted to
see
how much "blow away" really ment. My other post will include the ftp
address
for a file we all can use for a simple test. It looks like from Chris's
post above that we would have problems timing a test if each event takes
less than a second.

Perhaps I read too much into your comment, then.

Nonetheless, there are still plenty of *corporations* that have dedicated
programmers. I dislike some of Adobe's business practices as much as
anyone, but they have long used highly skilled programmers to write tight
assembly code for Photoshop filters.

>>Assembly is hardly a "corporate no-no". There are tons of commercial
>>programs which use it.
>
>Corporations are more concerned about getting their product onto the street
>on time and on budget, no time for optimizing.

See above. There are a large number of programs for which performance is
an important enough problem that optimizing does take place.

>The fact that simple apps come on multiple disks or CD's is a testament to
>this when compared to relatively similar apps written in tighter code.

Actually, with the proliferation of CDs, it's often cheaper to burn a
single CD than it is to dupe a single floppy. And as long as you've got
that much space, you might as well use it for something... like online
documentation, which is much more common on the Mac and PC.

To give you an example of a really well done Macintosh application,
consider Word Perfect 3.5 for Mac. It is a very nice, easy to use, full
featured word processor. It is hellaciously fast. And the core word
processor itself takes up just 5.6 MB on my disk (the app itself, and the
files necessary for spell and grammar checking). The remainder of the
files (file format conversion filters and various forms of online
documentation) occupy another 7 MB.

>>Writing programs entirely in assembly is out, though. There's no purpose
>
>It is "out" in the Mac and Win world because it takes too long, it is easier

It takes too long no matter what platform you're on.

> In the Atari world, it is "in" because a highly
>optimised app (or OS in the case of MagiC) can be run with decent speed on 9
>year old equipment.

Exactly. And even so, with the use of the 90/10 model I detailed, you
could get programs that ran just as fast, but were far easier to write and
maintain.

For example, GEM user interface code is very easy to deal with in C. Not
so in assembly. And you'll never notice the speed difference, because the
code is not CPU intensive, with the exception of GEM drawing routines.
The drawing routines of any OS are a great candidate for assembly.

Uhhh, how about all of the 9500 and 8500 type chassis based machines directly from Apple? Or any of the PowerComputing machines which ship with various ATi cars? Or the Motorola machines which have an ATi card on the motherboard? You mean those ones?

Maury

1) Perhaps the distinction is only in the packaging and marketing of the
cards.

2) The Number Nine Imagine 128 works in both Macs and PCs.

I can't think of any other PCI cards that are exactly the same for Macs
and PCs off hand... I'm sure other people could think of some more examples.

> >With PCI Macs, there is no special hardware needed to support Macs as

What precisely do you mean by "PC video board"?

ATI's Xclaim VR seems to be very similar (if not identical to) the 3D Xpression+TV. I don't know whether the cards are precisely the same with different packaging, labeling, and drivers or whether they have differences between them that would preclude one being used on the other platform.

As I understand it, some graphics cards that work on Macs automatically accelerate graphics, and need an extension (or control panel) to disable acceleration (the extension/control panel can also be used to patch portions of the card's driver).

This is dependent on the card maker's implimentation though (if the drivers are not on the card, then they'll have to be loaded from software).

> Both machines are identical in this respect.

Actually (and this depends on implimentation), some cards automatically
accelerate QuickDraw operations and don't strictly need an extension.

I wonder though, can PCs change color depth or resolution without a
driver or is there just one specific resolution/color depth that is
available if you don't have the appropriate driver loaded?

It's possible that there are exceptions, but with all the graphics cards
that work in Macs that I know of, you can change resolutions/color depths
(on the fly) even if you've installed no software on the Mac for that
card (so you may have no acceleration, but it will work normally otherwise).

> >To enable graphics acceleration, an extension would have to be loaded.

Except in those cases where the extensions job is not specifically to enable
the card so that it works.

Possibly. I don't know the details of it though.

> Navigating and searching multiple mounted volumes get tedious.

What desktop are yo using? If MagiC/Ease you can do this from the
desktop by selecting the drive icons you want searched, go under the
File menu and select the 'Find' option, type in the file mask you want
and let it go to it! You will be shown windows for all occurrences of
the mask.

If OTOH you're using the standard old TOS desktop, get the shareware
file selector 'Selectric' and use its very nice FIND function to search
for the file mask you specify.

I said nothing of the kind. It's genuinely pathetic when you
MacVocates must resort to lying to make a point. Note that
the fellow said that the card in question required special
software be added to the system. This is precisely what I have
been saying would be required for a platform independent video
card on a Mac. You can't even honestly characterize information
that's in front of you much less anything more distant.

Any vid card not catering to the Mac will have the same configuration
complexities as a PC card.

There are a couple. I usually use the "find" function built into Little
Green Selector (it's always readily available), but a WHEREIS program exists
(probably several of them, actually).

How can you tell that this MacVocate is lying?

His mouth is open.

I have explicitly stated before, for those to dense to get the reference,
that VGA++ was an acknowledgement that the Mac's video cloning standard
was more robust. This person's Diamond problems don't contradict anything
I have said. Furthermore, Diamond is an exceedingly poor example.

I'd just love to see the mess they could make of Mac PnP...

So a native OS like Be runs faster than an OS running under double
emulation, big deal!

>3-4 times a *day*? <

Correction, 3 to 4 times a week.

>For _what_ exactly?<

You name it.
I lose keyboard control quite a bit, only way to get it back is to reboot.
I get the system is busy blue screen all the time, for many programs
System and program settings change for no reason.

Those are a few of the more common ones on my machine, I administer four
other machines in the office, peer networked. All of which have Pentiums
and 16 Mb of RAM or better and there all still sluggish.

One of them stopped asking for a user name and password when you first boot
up, then you have to shut down and log on as a different user to get on to
the network. Compaq has been no help MS support is stumped. Windows
magazines Fred Langa was sumped. It seems I spend more time troubleshooting
Windoze than actually getting any work done.

What's really funny is Win95 is better than it's predecessors. I used and swore by Wintel machines for ten years, then I used my first Mac at a computer store, after 20 minutes I finally realized what a computer can be. I'll never go back.

It is a non-accelerated generic driver that uses VESA PMI to set and
change video modes. Thanks for pointing out the name.

>>and maybe NT also have generic drivers that use the VESA interface. (I

>Not. At least nothing like OS/2's GENGRADD.

Probably not, though there is no reason, other than poor performance, that
NT should be missing drivers for VESA based frame buffer access.

Yes. NT has the equivlent of these as well. (And the Linux XFree86 servers
each support a family of video adapters as well.)

The size of the driver and where it is located is irrelevent. As long as
it doesn't reside as part of the kernel, and takes hardware specific
features and abstracts them to a standardized API, then I consider it a
driver.

A driver on a ROM is still technically a driver, no?

[deleted]

>driver, which has to be on the ROM in the card itself. But then, part
>of MacOS is in ROM, so this is not surprising.

After doing a little checking, yes indeed, I agree with you. Many Mac
video cards do indeed place their driver on a ROM chip onboard the card
itself.

Regardless, a driver in ROM is still a driver, albeit one that
doesn't require installation. :) A good thing, for ease of use.

In any case, I consider having things in ROM as a fairly big disadvantage
when it comes to updates and bug fixes. Of course a common thing on the

PC. sigh. :(

Still, I'd much rather stick in a disk and install new software instead of pulling a ROM chip or loading a patch. (Even with Flash RAM I'd still have to pull the card, reset the safety jumper, and then do the Flash RAM update.)

Revised claim:

"The Mac typically supports accelerated video through the use of drivers embedded on the video card in a ROM chip. This eliminates the need to seperately install drivers. Certain developers may choose to ignore this convention and implement the driver PC style."

"The PC supports non-accelerated video through the VESA video bios, which on many video cards functions much like the Mac style ROM chip, except mostly without acceleration features. Some acceleration features may be enabled by VESA 2.0. For accelerated video, the PC relies on drivers loaded by the OS at boot time typically from the hard disk."

It's called GENGRADD. For an nonaccelerated driver, it seems to play
Quicktime movies rather fast, and gets you resolutions like 1280x1024,
depending on the card it detects.

>and maybe NT also have generic drivers that use the VESA interface. (I

Not. At least nothing like OS/2's GENGRADD.

More important for OS/2 are generic chipset drivers. This means, for
instance, the same S3 driver works with all S3 chipsets and S3 chipset
cards, without having to even reinstall if you install a new S3 based
card. Ditto with Cirrus, Trident, ATI Mach 64, even the Matrox cards.

>could be wrong.) Linux definately does. (Unaccelerated X-Server)

>Aha. Driver.
>

Wrong Darwin. I look at my Mac graphics card and the so called
extension closely. The extension is far too small in terms of kb size
to be a driver in the same sense in the PC drivers are. The Mac
extension is more like a control utility, similar to all the utilities
you find in PC cards as well---to enable, disable and set settings. The
extension may only contains patches to the *real* driver, which I
believe is actually in a ROM inside the Mac graphics card itself.

This is the only way I can explain why at the moment of installation
without installing the extension, all the specific, and quite
nonstandard video modes and virtual desktop modes of my card are
automatically available and functional at the first bootup. Including
accelerated features---I can remove the CDEV from my system folder and
it still shows the effect of acceleration.

There are Mac drivers, but their nature is different from what we expect
of PC drivers.

>

At least for my 1724PDS card, that extension isn't a driver. Again, it
depends on the implementation---there is nothing stopping a vendor from
implementing the driver as an extension, or as a ROM in the video card.
The extensions of various Mac graphics cards are too small to be
actually doing the work of a full driver. At best, they seem to be
patches or used as a bridge between the OS and the real
driver, which has to be on the ROM in the card itself. But then, part
of MacOS is in ROM, so this is not surprising.

>Sounds a lot like Win95, actually.

No. It's just a utility, a switch. The real drivers are there
somewhere I believe in the graphics card itself.

In my case, I need the extension only to *disable* the acceleration and
to customize the key combinations to activate pan and zooming. In other
words, only to *change the default settings.* The card is functional
without the extension, including all modes plus virtual, pan and
zooming and acceleration.

In fact the settings are immedietely changed, including acceleration on
and off, as soon as the control panel extension is closed. I don't have
to reboot.

> need for configuring hardware or software.

Except there are many cards that AREN'T VGA... there are the VESA cards and the XGA, and many other TLA's that I don't remember and more than a few proprietary ones... so you are saying that the PC's PnP works often - and thats as good as the Macs always (or damn near it).

There is a difference in degrees - and you will be raised to a new level of "assholishness" if you are so blind that you can't understand the difference between Macs PnP and PC's russian roulette (usually it works - but sometimes it blows your head off).

BZZT! WRONG! There are many cases where it does. Most cases it does not.

It's not a fair test...

Let's go one step further.

Here are my results using ImageCopy on a T60 with 32 MB RAM.
800*600*256 screen resolution

20 640*480*24-bit JPEG images set up as slideshow.

* note: the processes involved here are, load from hard disk, decompress,
dither to 256 colours and display.

26 Seconds.

Caveat, ImageCopy only lets you choose "full" seconds as wait time between
images in a slideshow, ie: 1 second is the smallest wait time. If I could set
Imagecopy to reload after .25 seconds, I do not know if the total time to
complete the slideshow would be better, I assume it would.

I already know how fast a 9500 with GraphicConverter does this test and it
is nowhere close.

All the best,
Chris @ Computer Direct

You just contradicted yourself here.

Although Linux is quite a bit more intellegent about it's VM,
you will still take a performance hit if you depend upon it too
much; Linux developers admit as much. On the less robust systems,
this situation is magnified.

Unless you are running a big-iron OS and a fast disk, this is indeed
the case. The other micro-OSes just aren't quite 'modern' enough yet.
Even the ones that are can't outrun physics...

So figure out a way to get me these images and I'll decompress them and time it.

Slideshows are not desirable for a real test. You can't tell what part of
the time was spent processing and what part waiting.

What I think I may do is tile together a very large image (say, 3000x3000
resolution or so), in order to get a file that takes a long time to open,
so it can be timed properly. We may also want to load things from a
RAMdisk, in order to eliminate the variable of who happens to have the
faster HD.

(Funny thing is, I just realized my challenge won't prove anything one way
or the other... both sides will have things to fall back on, because it
isn't exactly a rigorous test.)

So you won't mistake which one is for the Mac, and which one is for the
PC.

>
> As far as XClaim drivers go: I'd rather just get the PC version
> and spend 33% less. (Rage II ?)

Actually, the prices of ATI cards are fairly the same for both PC and
Mac versions. The exception is the low end ATI Graphics Expression
which has no Mac equivalent, but isn't faster than built in VRAM
based Mac graphics subsystems found in PCI Macs, and the fact that in
many Mac clones (Motorola and Power Computing in mind), an ATI Mach 64
264VT chipset is standard built into them. If that Mach 64 is paired
with DRAM, this is already the performance equivalent of the Graphics
Expression. If that Mach 64 is paired with VRAM, the equivalent would
be the Pro Turbo. Thus, Mac graphics cards, in essence have to be high
end, high performance, or you will be throwing money with a low end card

that isn't faster than the fast built in graphics system.

Bigotted? How so. My comment was made in reference to the "Corporate"
programming companies, not individual code hackers. Without naming any
specific "Corporations", I think you should be able to figure out to
whom I reference this point to.

Surely there are hobbyists and small guys programming in their basement
that do a wonderful job on software for all platforms. You just don't
see their stuff in the stores or in the catalogues etc. because it is
mostly PD/Shareware.

>>Many Atari programmers work in machine assembly code, a corporate no-no
>>in the Mac and PC market.
>
>Assembly is hardly a "corporate no-no". There are tons of commercial
>programs which use it.

Corporations are more concerned about getting their product onto the street
on time and on budget, no time for optimizing.

The fact that simple apps come on multiple disks or CD's is a testament to
this when compared to relatively similar apps written in tighter code.

>Writing programs entirely in assembly is out, though. There's no purpose

It is "out" in the Mac and Win world because it takes too long, it is easier
to use higher level languages. In the Atari world, it is "in" because a highly
optimised app (or OS in the case of MagiC) can be run with decent speed on 9
year old equipment.

All the best,
Chris @ Computer Direct

If you must guess, at least don't post your guesses. VESA has the ability to do all resolutions the card can do, at all colordepths.

Granted, I'm talking about DOS here, but VESA is a graphics card addressing standard, and it doesn't require a software driver (made especially for the graphics card) in order to work.

I don't know why ATI choses to do that.

It could be they are targeting a different customer base. ;)

> The Mac could be using VME
> for any reall effect PCI has...

After checking their website, it looks as if the 3D Xpression+PC2TV isn't
quite as good as the XClaimVR.

They both accelerate 2D and 3D graphics.
They both have television output.

Only the Xclaim has video input built in (from VCR or camcorder).

With an extra card, both can be used as a TV tuner, but the PC's version
of the add-on card is what provides the video input.

> As far as XClaim drivers go: I'd rather just get the PC version
> and spend 33% less. (Rage II ?)

To have equivalent features for the two cards (both with 2MB RAM):

For the Mac you would purchase the XClaimVR and the XClaim TV tuner
($229.95+$89.95 = $319.90)

For the PC you have to buy the 3D XPression+PC2TV and the apprpriate TV
tuner card from ATI.
($162.95+$119.95 = $282.90)

That's a 13% ($37) price difference.
(Prices are from Cyberian Outpost <http://www.cybout.com/cyberian.html>)

I don't know what the differences between the memory systems are. The XClaim uses SGRAM and the XPression uses "single-cycle DRAM memory". Whether those are the same or not or whether one is faster or not, I do not know, but that could possibly account for the final price difference.

I didn't see a "single-cycle DRAM memory" or any memory upgrade for the XPression listed at Cyberian Outpost, though that doesn't mean that such an upgrade doesn't exist. The 2MB upgrade for the Mac is $84.95.

Actually, if a GPF occured, my experience tells me to better shutdown and reboot the system. This is because there is already some corruption in the memory. I encountered several times after a GPF, everything looks OK but program which are stable (eg print manager) will themselves encounter GPF.

>I don't know what the differences between the memory systems are. The
>XClaim uses SGRAM and the XPression uses "single-cycle DRAM memory".

SGRAM is the same thing Matrox is claiming that's faster than DRAM and is used in the PC only Mystique cards. Like DRAM, SGRAM is single ported. Matrox is also using something dualported they say is faster than VRAM ---heck, I forgot the alphabet soup--- for the Millenium cards. Check http://www.matrox.com to read more about these sort of memories in particular. And when you're there, enjoy the feud they are having with ATI.

As for as the Xpression goes, that's just plain DRAM. I would say both have the same ATI chipset, but the use of SGRAM on the Xclaim card makes it more expensive the Xpressions card.

It would be *suicide* for a card manufacturer to sell a video card with DRAM because in the Macintosh side, the levels are much higher. You can't sell a card whose performance is lower than the built in video of a PCI Mac---which has dual ported VRAM standard. In the PC it's different because for a lot of them, the video is not built in to the motherboard, and second, if they were, they use DRAM. Price is very important in the PC side because of heavy competition and OEM bundling. Performance is more important on the Mac side because of higher expectations.

Rgds,

Chris

Obviously more physical memory not more virtual memory makes your computer faster. VM does not slow a machine much as long as you don't "depend on it too much" as you say and cause the hard disk to be thrashed to pieces. Just the extra VM layer shouldn't slow things down too much - lookups must be done to ensure memory protection anyway - particularly as it can be very helpful.

Most systems do not take kindly to running short of memory. Running a computer slightly slower all the time and not crashing is IMHO better than running it slightly faster and then getting _bad_ crashes (i.e. disk corruption and/or reboot) when Netscape messes up and gobbles up loads of memory. Or when you're compiling Modula-3 programs (why I needed the extra

MB :)

YOu can do large screens and panning with VESA 2.0.

However, using VESA2.0 disables the majority of acceleration features on a
card. :(

DOS SVGA games are typically the only real users of VESA2.0, mostly
because they don't have the choice of using accelerated drivers..

>services? For instance, what if the menu system was the video driver?
>Odd example I know...

Unlikely. Using OS/2 as an example, the API layer(PM) usually calls down
to a lower level of software, like the graphics engine (the GRE),
which then breaks down complex operations into simple easy to accelerate
ones. These operations are then sent to the device driver (GRADD), which
actually talks to the HW. If the GRADD replies that hardware cannot
perform that particulr operation, then the GRE emulates the operation.

This is also why drivers can differ wildly in quality, even within the
same card family. Developers may initially implement a driver accelerating
very few features, then slowly add acceleration as the driver improves.

Of course, I acknowledge that there are exceptions to everything. :)

I will tell you one thing. The SVGA DOS game I have that uses VESA 2.0
ran faster than its Windows 95 equivalent using DirectX. On an action
game like Mechwarrior, it shows.

Talk about GRADD. GENGRADD in OS/2 is the only driver I know that must use VESA 2.0 (except I suspect, some Linux X-free drivers). I get all sorts of resolutions without installing drivers for the video cards. Furthermore, I can shut down the machine, change the card, and reboot back into the same resolution. It's slower than the dedicated drivers, but surprisingly, on a Cyrix P166+ and a card with fast frame buffering, you can do full window drags and play Quicktime movies with surprising speed. I have a Matrox Millenium, but I have tested this with a Cirrus Logic, various S3 and an ATI Mach 64 card.

However do not confuse Quickdraw and Macintosh graphics with non accelerated VESA drivers. While I can plug and play graphics cards on OS/2 with GENGRADD, I don't do it with true native acceleration---just the sheer speed of the OS/2 GRADD driver and GRE system. The Mac is different, install and acceleration is instantaneous. Extensions are for patches and control settings. The driver for the Mac card must be built into some ROM, and when the machine boots, the Mac must detect the card, patches the trap dispatch table to vector calls into the card's ROM (instead of its equivalent in the Toolkit ROM). At least that's my theory anyway.

On my 100MHz Pentium, opening a folder in the explorer (WinNT4) takes several seconds as the OS needs to open every application to retrieve the icons for that file. If I smaller icon, it's faster as the rendering is faster. On my Falc, it's faster as it don't have to open every application to read the icon.

Your definition of bearable is seems to be different from mine. Not to
mention I've never used the word "annoying" when describing my Mac.

sometimes my keyboard goes dead, most of the time it works partially, I've
tried diff. ones so I can't see how it's the hardware.

> >I get the system is busy blue screen all the time, for many programs
>
> Have you checked your hardware?

My point exactly, on a Mac, if for some strange reason there was a critical
problem it would let me know, not give a bunch of addresses, this might be
interesting or useful to a techie, but not to me.

> >System and program settings change for no reason.

actually, the user did nothing, all the network setting a correct. If it were as simple as a setting change it would be possible to make any networked win95 machine do this, give it a try. When networking is turned off, the choice to close all programs and log on as a different user isn't available.

The design of the PC and Mac versions of the following cards: Matrox
Millenium, the ATI Mach 64 cards, even the Diamond Javelin to the
Stealth are about the same.

Even the chipsets are the same. The Motorola MacOS motherboards use the
same ATI 264VT chipset as the ATI Graphics Expression cards for the PC.

Take a look at the Matrox Millenium for the PC and the Mac. Both are
absolutely identical in pictures, with the only difference being the Mac
version being longer because it has 4MB on it as base instead of 2MB.

> I said nothing of the kind.

"JEDI", you've been saying exactly that for the last two weeks. To be
exact you've continually made several claims:

a) PC based display cards don't need drivers (just plug in a SVGA card and
off it goes)
b) Mac cards need drivers
c) PC cards won't work on the Mac
d) ISA works on multiple platforms
e) Mac cards are nothing more than "dumb frame buffers"

etc etc. Whatever turns your crank I suppose.

> It's genuinely pathetic when you
> MacVocates must resort to lying to make a point.

Yeah, sure.

> Any vid card not catering to the Mac will have the same configuration
> complexities as a PC card.

That's because it will need to work on the PC. That's called "lowest
common denominator".

Several such programs exist, I believe Parafin is a popular one.

In order to launch programs from it, however, you will need an AV-Server.
I recommend Thing.

Hello all,

I'm sitting on a load of lzh files that i can't seem to decompress. I have LZH201L.TTP and ARCSHELL but I'M stuck. Sometimes I get cryptic error messages (sorry, I didn't write them down) about the archives not existing. I'm sure of the path and procedure so I'm perplexed.

All i really want is a down and dirty little utility that will decompress these lzh files. Please help me!

Thanks in advance

Mykle

If your talking about the file I posted,
just for giggles, the (my) Falcon will
load it at full picture size (virtual screen)
at 16bit color in 10.2 seconds. Pretty slow
compaired to the T060 :(. But a good three seconds
faster than my Quadra :).

>Perhaps I read too much into your comment, then.

I think that there is way too much emotional attachment to silly pieces
of silicon and plastic. We could all take a lesson from Mr. Sinclair.

To give you an example. MagiCMac is a complete 32 bit preemptive
multitasking
OS with memory protection, threads, signals, pipes etc. etc. etc. for
the Mac
it is shipped on a single 1.44 MB floppy complete with a really slick
desktop
called Ease which I prefer hands down to the Mac Finder. It is faster
and more
stable actually.

Sure, MagiCmac does not have some of the other features (of which value
is
debateable) of MacOS.

An excellent example of what can be achieved when the time and energy is
put
into it.

>Exactly. And even so, with the use of the 90/10 model I detailed, you
>could get programs that ran just as fast, but were far easier to write and
>maintain.

Not being a programmer, I cannot really debate this with any authority. Others
will have to do that for me. All I know is that Papyrus under MagiCMac on my
Mac outperforms Word perf 3.5 on the same Mac. Faster loading, faster scrolling
etc., and yes I agree WP 3.5 on the Mac is very fast ... for Mac word pro's.

All the best,
Chris @ Computer Direct

Just because people were buying one thing doesn't make it better. Sales
and good products many times have no relation at all.

> The end result was that IBM scrambled like mad, according to a Radio
> Shack executive friend of mine, shipping "Free coupons for Windows 95"

Maybe these machines were simply left-overs from the DOS/3.1 mass. If
95 is doing so damn good why do I still see Win 3.11 and DOS in even
mass catalogs such as Global? Why do 99% of the people I know still use
Win3.1 and DOS? I am not saying you are wrong and I am right. Only that
that situation can be interpreted in many different ways. This "Radio

Shack executive" is nomore on the inside than me.

It would not have been worth IBM's time to go back and "debox" and reload 95 on these machines. There are many reasons for not having 95 on them to start with this is only one.

It all depends on how the game is programmed.

It is very possible that a DirectX game that takes advantage of
acceleration feature can end up faster then a DOS game that doesn't.

>>> Well put, but that is that is also part of the API for application
>>>services? For instance, what if the menu system was the video driver?
>>>Odd example I know...

>>Of course, I acknowledge that there are exceptions to everything. :)

>Talk about GRADD.

Just a note of clarification for those that don't know.
GRADD is not GENGRADD.

GRADD stands for GRaphics Adapter Device Driver. This is a new driver architecture introducted first with OS/2 PPC and then OS/2 Merlin.

GENGRADD is a driver written to the GRADD speficication that supports video cards generically via VESA video BIOS routines and linear frame buffer.

>However do not confuse Quickdraw and Macintosh graphics with non

>theory anyway.

You are probably right. This is the way the OS/2 GRE works with GRADD video drivers as well. The GRE dispatch table is altered by the driver when it loads. Any entries not altered, are set to point to software graphics functions.

Until Merlin, the OS/2 GRE did not have a software implementation for many GRE functions. This made OS/2 video drivers large and difficult to write, as all the functions had to be supplied by the driver vendor.

Unfortunately, being able to run unimplemented functions in software is something I recall Windows has had for a long time (I could be wrong).

It should not be difficult to have something like GENGRADD for Windows, however, no vendor would ever consider actually releasing a card that used such a driver.

There are now extensions to the VESA speficication (VESA VBE/AF) that allow use of accelerated features, but these extensions are rarely supported at the present time. (See the Display Doctor 5.3 Universal VBE extensions for details. http://www.scitechsoft.com/sdd.html)

If you would like Michael, I can time this file for you
on the DirecT60 in various packages, such as ImageCopy.
Photoline and DA's Repro and post times for rotations,
Filters etc.

Where di you post the file?

All the best,
Chris @ Computer Direct

Oh, i'm already sold:) But it would be fun!
>
> Where di you post the file?
>
> All the best,
> Chris @ Computer Direct

I guess my other post didn't make it
out from my other news server:(. Tim
wanted a jpg file we all could use for
a common test. There is a lot more
involved in displaying the .jpg than
pure processor, but I thought it would
be fun. Especially as he is using standard
Mac video and the T060 you have is probably
using the ATI card :).
Anyway it is a file called ab.jpg.
It's about 230K and around 933*1300 res 24bit.

ftp.ridgecrest.ca.us/pub/users/m/mgrove/

I ran it on my Falcon with a 50mhz DSP/32mhz CPU
and 16mhz bus. The .jpg and viewer (jpegv222.prg)
were located in a ram disk set up in ST ram.
Operations were performed in fast ram. The image
was displayed in a virtual screen (full image size)
in Falcon 16 bit mode. TOS was located in fast ram

(along with a few other apps:).
I timed it with a stop
watch from mouse click to the bell tone that
occurs when the file is completely loaded.
The second fastest way to load it was while
in Apex Media. It loads quicker than the
Apex .jpg viewer, but because Apex resizes the
image it took an additional three seconds.
Oh, the image is the cover of ST Computer,
a Falcon with two Shuttle type boosters attached
to each side of the machine. When Titan gets
the Nemesis over here, I think the load time
will go down quite abit. The 16mhz bus is a
bottle neck now to and from the DSP running
at 50mhz. It will also be nice to run my
Mighty Sonic at 48/24mhz (God providing:).

Mike

Just another point of view. I worked at Radio Shack at the time and we had
to beg other stores in our district to send us Aptivas. We couldn't keep
them in stock... at least after I made sure that they booted up to Windows
and not OS/2.

:
: The Mac OS has evolved over nine years from System 1.0 to 7.6 with lots of the
: latest and greatest..

It's odd, then, that it still doesn't sport pre-emptive multitasking. I'll
have to use MkLinux or MagiCMac in order to get that.
Also, it doesn't feature any command line interface, and is prohibitely
slow and memory-hungry.
As for now, Rhapsody is but vapourware.

: Next July will see Tempus and by Jan the first incarnation of Rhasopy with lots
: of good internet stuff.

They will finally add ping, traceroute, whois and nslookup?

: > It's not cheap. Good computers AREN'T cheap.
:
: Maybe so on your platform. Here in Mac land, $1599 buys an APS M-Power 603e200.
: 200mhz PPC 603e, 1.2GIG, 10X CD, 16 Megs/256K L2 cache and keyboard/mouse.

They are produced in larger quantities, which explains the pricing.

:
: Whats that? 2 apps a year?

This is funny, the dog jumps on the cat which jumps on the rat. The PC owners always talk about how little software there is for the Mac, and Sinclair talks about how little software there is for the Atari. Do you really have such a need for tens of different word processors?

: > Sorry Tim, my crystal ball says Apple won't be around that long without
: > major reorganization. The real question will be if the clone
: > manufactures
:
: What I would like to know how a company posts a loss but increases their cash
: on hand?

I'm not worried about Apple. They're big, and there are clone manufacturers. If they just get their thumb out their arse, they'll manage. Perhaps with a smaller part of the market, but who cares? Your Mac will still work, and you will still be able to get it fixed when it doesn't work, and you'll be able to buy new software, as well as use the same old software you use now. Apple won't go bankrupt, their downsizing isn't that dangerous, the Atarians have survived for several years as orphans, and the Amiga has been without owner for more than a year, and is now again without one.

: > are willing to invest in what Apple has purchased. This is of course my
: > own opinion, but Apple's performance in the market does indicate
: > problems
: > on the horizon. Time will tell.
:
: Are you kidding? PowerComputing is on a roll. Power reportedly sold over
: 200,000 units in 1996. Not bad for a two year upstart. I bet that their
: revenues are at least $500 million. I would suspect that they will break a
: billion this year. And yes they are very profitable. Motorola shipped 40,000
: units from late Nov-Dec period of last year. I suspect that they will do even
: better. Power is the next Dell/GateWay

And Apple owns Power stock, so that's beneficial for them too.

: Apple should make Claris public, a $250 million software firm. Just offer upto
: 50% of the company to the public and rake in the cash.
:
: Claris, Power, Motorola and Umax could handle the OS as a consortium if
: something happens to Apple.

That's right.

```
Mailloop v2.0 is an industrial strength bulk mailer.

Using it is easy:

1) Create a message (http://www.mailloop.com/editor.html)
....by using the pull down menus or
....by using any editor

2) Create a newsgroups list (http://www.mailloop.com/news3.html)
....by filtering an NNTP server or
....by importing from any text file or
....by manually creating with any editor or
....by extracting from any FTP file or
....by extracting from any HTTP file

3) Create an e-mail list (http://www.mailloop.com/em3.html)
....by extracting from newsgroups or
....by importing from any text file or
....by manually creating with any editor or
....by extracting from a WHOIS response or
....by extracting from a fingering response or
....by extracting from a UNIX response or
....by extracting from any FTP file or
....by extracting from any HTTP file or

4) Broadcast the message
....to the e-mail list or (http://www.mailloop.com/embc.html)
....to the newsgroup list (http://www.mailloop.com/ngbc.html)

5) Then process the remove requests
....by using the mailbox processor (http://www.mailloop.com/pop.html)

Tempus 2 exists. Therefore you would not need a CPU 10x faster than a
68000 to scroll faster.

I don't think I ever saw Tempus 2, but Sudden View (also on the 8 MHz
Atari) was very, very fast.

I guarantee you that it is easily possible to write a DOS application
which will whip the pants off of anything in scrolling speed. The
advantage Tempus 2 has over programs you have likely compared it to is
that it only has 32000 bytes of screen memory to update when scrolling.
But a DOS box in text mode has about 2000 bytes (4000 if you update the
attribute bytes as well). Even if the video card is on an ISA bus, the
potential scroll speed is impressive.

Well, Chris' test was for twenty 640x480 JPEGs. On my computer a 640x480
JPEG generally takes about 0.5 s to decompress and display (dither or
not).

Disk array, eh? (No way you get 20 MB/s sustained from a single drive.
There aren't any drives out yet that can sustain more than about 10 MB/s.)

> Hell, can I just blit

>address
>for a file we all can use for a simple test. It looks like from Chris's

>post above that we would have problems timing a test if each event takes
>less than a second.

I am relying on GraphicConverter's self-reporting of how long it takes to decompress a picture. However, it doesn't appear to time things with a greater precision than 0.1 s. (For the picture you already have on your FTP site, GraphicConverter decodes and displays it in 1.9 seconds. The second time around, when presumably it gets to load it from the disk cache instead of the real disk, it's 1.4 seconds. Haven't tried it from a RAMdisk yet.)

For a real benchmark, we would need to get hold of some JPEG decompression source code, so that the same source would be compiled on all machines. I could then also see just how much MacOS is hurting me, by recompiling it under Linux and BeOS.

BTW, I am quite sure that MacOS does hurt performance, if for no other reason than emulated interrupt drivers (ugh!).

>
> Roger

Hi,

I've been an OS/2 user for about 3 years, from OS/2 2.0 to Warp 3.0. I loved it. Especially Warp 3.0's interface. I have not tried Warp 4.0, but I believe the interface is even better.

OS/2 offered power users true 32 bit computing with preemptive multitasking as well as a level of power, stability and robustness which was 3 - 4 years ahead of MS. Until the release
of NT 4.0, there was nothing comparable on MS side. NT 3.x consumed too many resources, was too slow and had the outdated Win3.x interface. OS/2's interface still beats that
of NT 4.0 with a good mile to spare!!!

NT 4.0 has bridged the gap in terms of preemptive multitasking, stability, resource consumption and speed. I think that NT 4.0 multitasks more smoothly than Warp 3.0. I don't know
about Warp 4.0 though. From the apps standpoint, NT 4.0 has a lot to desire compared to OS/2.
The latest versions of practically every piece of software works on NT 4.0. I get to experiment with
the latest Netscape Communicator, Microsoft Internet Explorer, Photoshop 4.0, etc, etc. All of which
do not run in OS/2. I kind of got tired of always trying to fiddle with WIN-OS2, and that's when I could

get something compatible with it. Now, everything comes up in WIN32 and won't even run in WIN-OS2.
IBM's decision not to support WIN32 in Warp 4.0 has been the turning point for me. Big mistake,
at least until JAVA apps are well established out there, if this ever happens. There's probably another
1 - 3 year window until we see mainstream apps coming out in JAVA on a par with the release of
Windows versions. That's still too long for me to wait.

Whether OS/2 will dye has been the topic of discussion for as long as I can remember! IBM has no
doubt retreated from the consumer market. But, it will no doubt continue to service its business
customers, some of which have a very large investment in OS/2. So, there you have it. From the
single user perspective, there will always be a core of dedicated supporters of OS/2 for as long as
Microsoft gets its way with the computing industry. OS/2 has long been a superior product and it
remains so to this day. More compellingly, it's an alternative to MS.

With a great deal of sadness though, I have witnessed the decrease in traffic at various OS/2
newsgroups and other sites since the release of NT 4.0. This is not a coincidence. NT is taking
away the power user and business segments of the market. It's happening to OS/2 as well as
Novell Netware and slowly, in the Unix arena. MS has a whole lots of apps behind it, a huge hype
machine and a lot of momentum. All it has to do is come up with something almost as good as the
others to start taking away market share. It's sad but it's this way.

The advent of the Internet, the spotlight on Open Standards and the long awaited realization of the
merits of Open Standards, Netscape and Sun's JAVA may indeed bring about a real shift in the way
apps are developped, distributed and used. Let's all hope that it will be so for our own good. The
concentration of so much power and capital in a few hands is having serious detrimental effects on
the computing industry.

Finally, for those out there with smug remarks about OS/2 and OS/2 users, if you'e never used OS/2
for any lenght of time, you'd be well advised to keep your rhetoric to yourselves as you definitely
don't know what you're talking about...

Best Regards!

Thanks. QT2.5, on the second installation, installed SoundManager
3.2.1, so she's all set with CoolTalk, and now we can talk to each
other. Amazing how she had to download so much just to get a simple
program running. Under Windows, I just had to download one thing
(Netscape 3) to get it all working; under the Mac I had to grab
Netscape 3, CoolTalk (a seperate download, for some reason), QuickTime
2.5 (and SoundManager 3.2.1), and Open Transport 1.1.1. AppleGuide
was included in System 7.5.5, thankfully. I also grabbed
OpenTransport's OpenPPP, and we also updated her printer driver from
8.2 to 8.4.1.

MSIE3 on MacOS is not as good as the Windows version.
MSIE's Mail/News is about as good.

Without WWW access and a knowledgeable person to call on, I can't
imagine anyone else doing the above to get CoolTalk running on a
Mac. It's just too much trouble.

Apple doesn't exactly make that fact obvious, do they?

Anyhow, we grabbed the Net Installs and went from there. It's easier,
and it's just one download that way. Telling this to someone over a
telephone, especially when they're computer-phobic, isn't easy,
especially when you don't have a computer with that OS in front of
you.

Linux on the same machine does not maintain foreground response in the
face of 100% CPU usage nearly as well. (Linux crashes a lot less often
too, but then it's a much more mature OS than BeOS.)

Oh, come on. The point is that it's there if you need it. I'd rather
have VM around so that I don't have to worry nearly as much about running
out of memory.

> Virtual memory was developed in one context and then applied to another.
> This is a simple matter of computing history and architecture for those
> who know and understand the issues involved.

I would be very surprised, based on your postings, if you had much of a
grasp of computer architecture. If you do, you sure aren't using it.

Here, you carp that VM was designed for big iron, that it's inappropriate
for a small machine. In a word, your claim is BS. The machines UNIX and
VAX VMS originated on are blown away in raw CPU power, memory size, disk
size, and disk bandwidth by a modern personal computer. About the only
thing our small boxes lack compared to the big guns of yesteryear is
enough aggregate I/O bandwidth to handle lots of simultaneous user logins
from terminals.

You're really exxagerating the performance hit quite well. I congratulate you on your use of polemics.

In reality, VM performance hits are not the step function you suggest. You do not go directly from 100% performance to 5% or worse. There are a large number of situations where VM is active without impacting performance much at all. Sure, if you get your computer into thrashing behavior, performance will go to hell, but that's a characteristic of any caching system. Modern computer architecture is all about memory hierarchies and avoiding thrashing behavior between the various levels. VM is no different.

>>server to have decent performance, you must put enough RAM in it so that

And what the hell is that non sequitur supposed to mean?

Oh, wait, I get it. You're trying to make an obscure and clever reference to the scare that artificially inflated memory prices a while back. Unfortunately, as a response to the point I was making, it falls flat on its face.

>>So what's your point? That we should stay mired in the backwaters of

Ah, so now I'm a MacVocate. Funny, I don't seem to recall this thread, or at least my participation in it, being about the Mac for quite some time now.

For the record, I have many beefs with the MacOS. I own a Mac, partially because it's the last hope for non-Wintel personal computers, but I am not uncritical of it.

> However, since Petey-Boy himself seems to think that the OS is just

> of these limits is not addressed by MagiC 4.0?

Does it have VM? No? Well, that's an obvious start. Does it have much
in the way of network support? No? Does it have memory protection? No?
Sounds like a limitation to me. (Maybe things have changed, but in my
Atarian days there was little to no support for any of these things, and I
haven't seen evidence of them in my fiddling with MagiCMac.)

Does TOS have a 3D graphics API? Does it support hardware acceleration
for it? MAJOR limitation. This is hardware of today we're talking about.

Does TOS have anything like QuickTime?

I have enough to know that SCSI fast wide (or even RAID) doesn't quite
compare to multiple IO channels or solid state disk.

Furthermore, such knowledge really isn't required. All that I have
said can be demonstrated empirically with no technical understanding
needed.

[deletia]
>You're really exxagerating the performance hit quite well. I congratulate

>its face.

Money is never irrelevant. Perhaps this is the reason Mac is in its
current state. When I got my first ST, you could buy a new car for
less than some Macs. They're trapped in an academic mentality and
aren't capable of real engineering.

We are just fortunate that RAM doesn't impose the same kind of
constraints that it once did. To believe that it never will again
to the same extent is grossly naive.

Like What?

[deletia]
>Does it have VM? No? Well, that's an obvious start. Does it have much

It's a poor start. VM is not at all necessary. In microcomputers,
it only serves to allow developers to be immensely sloppy.

Memory Management would be a much better 'modern' requirement.

>in the way of network support? No? Does it have memory protection? No?

Actually, MagiC does. Network support can exist on the application
level and has been existent on the ST's for quite some time.

>Sounds like a limitation to me. (Maybe things have changed, but in my
>Atarian days there was little to no support for any of these things, and I

Yep..They had a loss but managed to increse their cash on hand. There will
always be a need for an alternative to Wintel. Apple needs to solve thier
manufacturing capacity problem with the PowerBooks and get those out. This will
be done by mid Feb. Hooper will do well, but fear it will be supply
constrained and Apple's PowerBook backorder will shoot up to $2 billion.

Interesting. Are you claiming that no programs for microcomputers require
large virtual address spaces? That is perhaps true but it is far better
to have a large virtual address space then to constantly read data from
a disk. Virtual memory paging algorithms are faster than disk caching
algorithms.

> For those parts of QT that actually get used: yes.
> Although, this is applications level as well.

What parts of QT do you think are actually used?

Your postings get more bizarre each time.

Running out of memory has nothing to do with the OS in question. It's a
matter of using the memory for programs. If you crank up enough of them
you will run out. If you run a single program that needs more than you
have free, you will run out.

>>I would be very surprised, based on your postings, if you had much of a
>>grasp of computer architecture. If you do, you sure aren't using it.
>

Um, you just demonstrated that you can masterfully make a dumb
comparison. Big machines might have multiple I/O channels for a RAID --
what do you think each of those channels is? Very often, fast/wide SCSI.
You can buy dual-channel UltraSCSI cards for Macs; they're intended mainly
for RAIDs. (Single-channel RAIDs are possible, but not as fast.)

> Furthermore, such knowledge really isn't required. All that I have

> try to put on things.

Strange that people don't use hard drives instead of DRAM, then.

OK, that's a cheap shot. I'll give you the benefit of the doubt and assume that you really meant to type it reversed. Simple mistake, everybody does it.

However, you should really look at VM in this light: VM is like having a large but very slow memory cached by the computer's DRAM. The computer's DRAM is in turn cached by an external "L2" cache, which is in turn cached by a internal CPU cache. Ultimately, the CPU keeps data it is currently operating on in extremely fast registers. Each level in this memory hierarchy is much slower than the one which preceded it. The idea is to avoid too many misses so that fetching from the next slowest member doesn't happen often.

The reward is that if the miss rate is kept down, you can make a slower but cheap memory perform almost as well as a faster but more expensive memory. The techniques for reducing miss rates are well known and are the subject of intense research by computer architects. Although the techniques used for caches are somewhat different from those used for VM, there is a striking amount of similarity.

Furthermore, both systems have breakdowns. Just as VM can sit there and grind the disk continuously, L2 cache can exhibit thrashing behavior which makes the system perform worse than it would without any L2 cache.

In both cases, though, the benefits are too good to ignore.

>>And what the hell is that non sequitur supposed to mean?

> Money is never irrelevant.

So you're trying to say that because RAM was excessively expensive for a while, virtual memory is bad? Sorry, either you're gibbering, or you're trying to sidetrack from the issue of whether VM is a Good Thing.

> Perhaps this is the reason Mac is in its
> current state. When I got my first ST, you could buy a new car for
> less than some Macs. They're trapped in an academic mentality and
> aren't capable of real engineering.

The fact that Apple had models in the 80's which initially retailed for more than $5000 (some were closer to $10000) does not mean that they had an "academic mentality". It means only that they were targeting a much different market than Atari. IMO, it was a mistake for Atari to ignore that market, since targeting it would have given the ST much more credibility as a serious computer, as well as ensuring that Atari kept up with current technology instead of falling far behind like it did.

It was also a mistake for Apple to ignore the low-cost market until recent years. There is no rule that says you cannot design a machine which is easily scaled to several levels of price/performance.

> We are just fortunate that RAM doesn't impose the same kind of
> constraints that it once did. To believe that it never will again
> to the same extent is grossly naive.

In the long run, RAM will get cheaper and denser. This is a very non-naive idea based on knowledge of what goes on in semiconductor manufacturing. The price scare of a few years ago and the current low prices are symptoms of a commodity market. But nothing will change the fact that roughly every 1.7 years (if I remember correctly), DRAM density quadruples. This is a rule which has held true for 20 years or more. It's why I paid $50 or so for 256K of RAM to upgrade my 800XL in the 80's and paid $90 for 16 MB of RAM a few months ago.

>>There are many things which cannot be grafted at the application level.
>
> Like What?

Like anything which needs to be global and standardized. You could try to graft something like UNIX pipes onto programs at the application level, but it wouldn't be nearly as good as if it were done in the OS itself.

>[deletia]
>>Does it have VM? No? Well, that's an obvious start. Does it have much
>
> It's a poor start. VM is not at all necessary. In microcomputers,
> it only serves to allow developers to be immensely sloppy.

How is it sloppy to be unable to anticipate that J. Random User will try to run fifteen programs simultaneously on his 4 MB Mac LC? Each of those programs could be as tightly coded as possible and J.R.U. would still run out of RAM.

I really think you're pulling this out of your hat. Most developers have to try to code for the lowest common denominator. That automatically includes trying to avoid dependence on large amounts of memory being present. As the average user gets more and more memory, developers set the bar higher and higher, but in no case do they just sit around saying "hehe, let's make our software a pig, we don't care, we don't have to".

Some developers are clearly much worse at efficiency than others. For example, Microsoft Word 6 for the Mac is an insufferable pig, both for the CPU cycles it burns and the memory it eats. The user reaction was to dump it, something which was probably a factor in Microsoft's recent announcement of its creation of a new Mac product division which will develop Mac products from the ground up. (As opposed to the current policy of doing poor ports from the Windows versions.)

> Memory Management would be a much better 'modern' requirement.

Define "Memory Management".

>>in the way of network support? No? Does it have memory protection? No?
>
> Actually, MagiC does. Network support can exist on the application
> level and has been existent on the ST's for quite some time.

Network support needs to be an OS service. It is too much to ask every application developer to reinvent the wheel.

MiNT/MultiTOS probably have at least a TCP/IP protocol stack, but there seem to be very few people that use those particular offshoots of TOS.

It is always very funny to see the extremist Atari advocates gloat about the LocalTalk compatible port on the Falcon. They never mention the fact that Atari didn't have an AppleTalk network driver (and, to the best of my knowledge, nobody outside of Atari has ever written one either). A network port without the software to support it is worthless.

>>Sounds like a limitation to me. (Maybe things have changed, but in my

>>haven't seen evidence of them in my fiddling with MagiCMac.)
>
> I'll consider this methodology the next time I fire up the PC
> Mac emulator: Executor. '-p

You were talking about MagiC. I assumed that MagiCMac is the same OS, just running on a Mac instead of an Atari. Did I assume wrong? I thought that was the idea behind MagiCMac.

>>Does TOS have a 3D graphics API? Does it support hardware acceleration
>>for it? MAJOR limitation. This is hardware of today we're talking about.
>
> API's are all applications level.

You have an odd definition of "application level". Usually it refers to code that sits in an application instead of in an OS. An API is the interface offered to an application for an OS service.

> Although 3D hardware acceleration would be a nice addition.
> However, this could also be added to TOS with no problems.

That doesn't change the fact that it's not there.

>>Does TOS have anything like QuickTime?
>
> For those parts of QT that actually get used: yes.

What parts do you think don't get used?

> Although, this is applications level as well.

Is it? Is it practical to expect every developer who wants to include digital motion video in their program to reinvent all of the technology that's present in QuickTime? QT means that programmers can easily implement fairly advanced features in their programs with minimal effort. It means that you don't have to worry about interoperability with other digital video programs, because if you use QuickTime you automatically get it. Just as an example, you can cut, copy and paste chunks of video using standard Mac clipboard operations between any two apps which support QuickTime.

This would be extremely impractical to do at the application level.

Hi Mykle,
Diamond Edge 2 not only defragments HD's but is also a complete
diagnostic and repair tool for all hard drives. Ultimate Virus Killer
is the best (and most up-to-date) virus software for the atari.
Both are distributed in the US by Toad computers.
Email them on info@toad.net
Hope this helps....
Cheers

That's a poor choice of words. This text I am typing now 'accesses'
the OS and by no means needs supervisor mode or to be running in
the kernel.

Those things which need to be there are by no means 'many'.

Howso? They both have to deal with the same locality issues.

>What parts of QT do you think are actually used?

That which is commonly used would be covered by MPEG.
Even the rest which are often touted and less often seen
would be covered by other formats (like vrml).

Your continued spamming of c.s.a.s is becoming annoying. You, Sinclair-Day,
"Jedi," Quinlan, et. al. - KNOCK IT OFF.

This bullshit has gone on long enough. Either take it to email, take it
SOLELY to the advocacy groups, or drop it.

Brian, the /algorithm/ isn't the bottleneck, as you well know. You could have a zero-time algorithm, and VM would STILL be slower than "real" RAM becasue VM uses that hard drive for the virtual memory space. It doesn't make a damn bit of differecne if the VM algorithm takes 1 microsecond or 50 microseconds - you can't get the data to or from the hard drive in less than about 8ms (on average for fast drives - slower for less-expensive drives).

Yet another specious argument blown out of the water...

Which leaves Win95 totlly out of the picture. <G> Bill G. forgot to mention
that it stands for 1895, not 1995.

>
>[deletia]
>>Does it have VM? No? Well, that's an obvious start. Does it have much
>>in the way of network support? No? Does it have memory protection? No?

Memory protection isn't needed in single-tasking mode, and to the best of my
knowledge, all of the multi-tasking OSes available for TOS-based computers
have MP options (which can be disabled if one has a burning desire to run an
MT on a plain-jane 68000).

As for network support - well, I have two TT030's networked with the
on-board hardware and free software at home. Granted, it's limited to only
256 nodes on the network - a really severe limitation for most home users,
I'm sure.

And if you want to talk about things that are missing - where's the MIDI
support in Mac OS? Where are the MIDI ports? They aren't on the
motherboard, are they?

You guys are ridiculous. Every person has his own favorite computer and/or
OS. An /intelligent/ being uses the system that does the job he has in mind
for the least money, in the least time, with the least hassle (or however he
decides to trade off thsoe three mutually-incompatible goals). EVERY
desktop computer has flaws and strengths, and there is nothing one can do
(in terms of applications) on one platform that can't be done on another.
Trying to "convert" Atari users to the Mac, or PC users to the Timex
Sinclair, or any other conversion, is not only a waste of effort, it's a
waste of bandwidth.

The continuous insistence on cross-posting this idiotic thread into a
non-advocacy newsgroup is not only obnoxious, it's a form of spamming. You
will note that I have redirected all but one of my follow-ups (momentary
lapse there).

You can't (shouldn't?) use the term "generally" when refering to a file
that can vary in size or compression. Compair your .5 to what you state
below. In a slide show the error in your statement adds up considerably.

> >Ram disk is fine here. Is 20mb/sec to fast?
>
> Disk array, eh? (No way you get 20 MB/s sustained from a single drive.
> There aren't any drives out yet that can sustain more than about 10 MB/s.)

Disk array? No, fast ram on the Falcon operates at about 18mb/sec with
the 030.
The image was stored in ST Ram and decoding and display was from fast
ram.
(of course using the FRB cookie to pass the data to ST ram for display).
Where did we get Disk array from? Let's stay on the topic.
>
> > Hell, can I just blit the image to another area and display it?

> RAMdisk yet.)

Your changing the test. Both Chris and I said we used a watch to time
from
mouse click until the image was completly displayed.
I used a stop watch. I use Graphic Converter
as well and the time it displays is definetly not the time it takes to
view
the image. Actually I think that the time is an estimate of the file
size as
it apears before the file is decompressed. Correct me if i'm wrong.
However Chris has not posted the time for his machine as of yet for this
same file. (nice picture, ehhh?). However I am pleased to know that
"blown
away" only means a factor of five concerning this test between the
Falcon and
an 8500 PPC (load time on my Falcon is 10.2 sec. Your time may vary.
Hey,
Magnus, are your reading this). We should change the test to from when
you
switch the machine on until the image is displayed :). Now that would be
cheating:). I'll repost the time from my Falcon when some additional
hardware
arrives shortly. I would suspect that the factor should drop to around a
factor of four.

338. Get the Atari ST/TT/Falcon "Ultimate Virus Killer" TOTALLY FREE

Newsgroup: comp.sys.atari.advocacy
Date: 1997-01-22 00:00:00 UTC
From: cronos@worldaccess.nl
Message-ID: <N.012297.160359.94@wxs4-15.worldaccess.nl>
Source record: 6691

Hi to all of you!

There is reason for some celebration! Since I started doing the "Ultimate Virus Killer" commercially, in spring 1988, I have personally sold 3000 disks (this is barring the sales through people like Oregon Research, CRL and Douglas Communications, about which I have no statistics). This morning I sent off the 3000th disk, which made me pretty content.
I'd like to celebrate this with all of you, so I am now offering all of you the opportunity to become a registered user of the "Ultimate Virus Killer" *for free*, yes, you read that correctly, at no charge! This means you'll be getting the latest version, 7.0, and you will be eligible to receive updates at a drastically reduced price.
Here's how to go about it (and a few conditions):

1) Send one formatted double density disk and 2 International Reply Coupons (3 International Reply Coupons if you live outside Europe) to "UVK offer", P.O. Box 67, NL-3500 AB, Utrecht. Instead of a disk, you can also add an extra International Reply Coupon.
2) Make sure it arrives at my P.O. Box by January 31st at the latest (!).
3) Only one free copy of "UVK" per address!
4) This offer does *not* count for people who are already registered users through me direct or through Oregon Research. It *does* count for people who have registered at Douglas Communications.
5) This offer does *not* count for people who live in the USA or Canada (contact orres@teleport.com to get your copy at a regular price).
6) If in doubt, or if you have questions, simply email me and ask.

The "Ultimate Virus Killer" is the industry standard virus killer for the Atari range of computers. It works on literally *any* TOS version, any hardware configuration, any multi-tasking system and "GEMulator" (and probably on any other good ST emulator such as Magic PC, Magic Mac and STonx, though this is unconfirmed). It recognises 98 bootsector viruses and 5 link viruses, and can restore the original bootsectors of almost 800 games and megademos. In total it can recognise well over 1800 different commercial and non-commercial bootsectors (viruses, anti-viruses, games, virus free disks, bootsector demos, etc., etc.).

Hope to hear from you soon...

The "fast" ram in my Falcon is 32bit, however to utilize video it has to
go through a "buffer" to get the info to the video (st) ram. It's a
small
card with a PGA mounted 030 and eight simm slots. Fits on the expansion
slot.
There is a newer card available now, looks the same but with an 040
sitting
there. "Blows" mine away. I wish Magnus or Frank would have tried the
"test".
The file is now removed.

I have an 840AV at work. It is a really nice machine for the price I
paid.
I think used it was $999.00. It's quite the performer with MagiC Mac and
the 40mhz CPU.

... in much the same way that walking from Los Angeles to Washington DC is faster than flying.

(Hint: 8ms [eight milliseconds] is really _eight_million_ nanoseconds, which is well over 1.3 million times longer than 6ns [six nanoseconds])

#include <stdlib.h>

main(void)
{
while (1)
*((int *) (malloc(1000000))) = 1;
}

This is called a malloc bomb. It eats memory. Fast. Nearly every OS
in existence will go down in a ball of flames if you try it. Even those
that support copy-on-write die, because this writes (It'd work faster on
those if you malloc'd the page size (unless the copy-on-write algorithm is
no good), but they die anyway). Go ahead, try it; you'll discover that,
by your definition, most OS's out there are quite ancient.

I say generally because that's my guesstimate of the average. I tried
opening several 640x480 JPEGs I had sitting around on my HD and usually it
was around .5 seconds. The JPEG files varied considerably in compression
ratio, etc.

>> Disk array, eh? (No way you get 20 MB/s sustained from a single drive.

Sorry, I thought you were referring to HD transfer speed, not RAMdisk
transfer speed. My mistake. You've got to agree, 20 MB/s would be
impressive from a single disk. :)

I assume fast RAM refers to RAM on a custom expansion card instead of the
ordinary system RAM, which loses speed due to the video refresh DMA. (If
I remember my Falcon architecture right.) Out of curiousity, do you have
a setup which allows the 030 to access that memory with a 32-bit bus, or
is it still limited to 16 bits? I remember people were developing boards
to do that.

One of the things that caused me to jump ship to a Quadra 660AV instead of
buying a Falcon was the way Atari crippled the architecture of the machine
with that 16-bit bus. It was pretty annoying to know that Atari was
releasing a machine which was not only slower than the prior TT just
because of clock speed, but was severely crippled in memory bandwidth.

>> I'm not exactly sure what you mean, but it sounds like it would be cheating.

>size as
>it apears before the file is decompressed. Correct me if i'm wrong.

It sounds like you're referring to the progress bar that displays as an
image is opening. That's not what I'm referring to. (Most of the time, I
never see it, since GraphicConverter won't even display it if the image
opens in less than a couple seconds.) I'm looking at the time reported in
the Information window, which you can bring up with a menu selection or
command-I. It tells you how long the image took to open, the JPEG
compression ratio, and some other stuff.

I will try to construct an artificially large image that takes 10 seconds
to open, so I can do a stopwatch timing to verify that GraphicConverter is
reporting fairly truthfully.

BTW, I discovered that GraphicConverter is actually making use of
QuickTime's JPEG decompression module. I may try this with JPEGview,
which (I think) has its own JPEG code, just to see if it is better or
worse.

>However Chris has not posted the time for his machine as of yet for this

Does the decoder you use take advantage of the DSP?

I do sort of have my hand tied behind my back; my machine doesn't have any
L2 cache right now (the one I had went bad). If anybody's still actually
interested in this when I get one again, I'll try to report some numbers.

>> For a real benchmark, we would need to get hold of some JPEG decompression

OK, just as long as you let me use one of the Apple TriMedia cards when
they come out. TriMedia is an extremely fast VLIW DSP multimedia
processor; the basic card is expected to cost about $100, and will be
quick enough to do 30fps fullscreen MPEG.

>> BTW, I am quite sure that MacOS does hurt performance, if for no other
>> reason than emulated interrupt drivers (ugh!).
>
>:).

I can't wait for Apple to release Rhapsody. Finally a real OS (and a very
cool one, too -- OpenStep pegs the way-cool-o-meter). I have my doubts
about Apple's ability to deliver a working MacOS compatability box for it
in the timescale they claim, but the core OS itself is already complete,
and NeXT has ported it to different platforms many times.

I do now recall that MultiTOS had MP if you had an 030.

I strongly suspect that a lot of Atari apps would break with full memory
protection, though. There are a lot of situations where you have to bang
on globabl OS variables. (This same issue is why Apple didn't just put
protection into System 7 way back when, although if you ask me they
should've just done it, and to hell with the compatability problems.)

The point was that since TOS has no built-in networking services, there is
no standard way for network hardware to communicate with applications, and
there is no standard network protocol. Standards are why it's easy for me
to network my Mac to the PCs in my apartment.

>The continuous insistence on cross-posting this idiotic thread into a
>non-advocacy newsgroup is not only obnoxious, it's a form of spamming. You
>will note that I have redirected all but one of my follow-ups (momentary
>lapse there).

I didn't invent the newsgroups line for this thread. Ding me for failing
to remember that I should edit it down to the appropriate groups, but I
have by no means 'insisted' on cross-posting it. And spamming is a pretty
strong term, given that spamming generally refers to the act of
deliberately posting multiple copies (not cross-posting!) to hundreds of
inappropriate groups, or flooding a single newsgroup with tons of junk
postings.

BTW, I added comp.sys.atari.advocacy back, because that's where I'm
reading from, and it certainly seems germane to that advocacy group.

Frankly, I'll probably be out of here soon. Advocacy arguments are a
waste of time, as you pointed out.

Personally, I'd rather have memory protection irrespective of the single
or multi tasking nature of the system.

For a computer with a RAM loaded OS, one would like memory protection
enabled so that it [the OS] can't be "creatively rewritten" by an errant
app.

And, with systems with co-resident apps (be they desk accessories or not),
the advantage of memory protection can be quite useful.

In essence, denying writes to memory spaces not owned by the current app.
Of all the protection violations I see, around 80% are writes to areas
unowned by the current app.

And, as an author of utils on the Atari 68k platform, I ensure my apps
are immune from such errors.

> I do now recall that MultiTOS had MP if you had an 030.

At a rather large penalty in RAM space, however. But, if you need 100%
accuracy and reliability of your data, this price is cheap compared to
corrupt data in a mission-critical app.

IIRC the Mac has had '030 models since 1989 (the IIcx and SE/30 were the
first, I think), why didn't Apple begin to implement memory protection
into later System 6 versions that were current at the time? It would have
made the transition into System 7 easier. And probably less traumatic.
And they'd have had less "it aint compatible" press as well.

:
: The fact that Apple had models in the 80's which initially retailed for
: more than $5000 (some were closer to $10000) does not mean that they had
: an "academic mentality". It means only that they were targeting a much
: different market than Atari. IMO, it was a mistake for Atari to ignore
: that market, since targeting it would have given the ST much more
: credibility as a serious computer, as well as ensuring that Atari kept up
: with current technology instead of falling far behind like it did.
:
First...Atari felt it was making a good move...because in 1988 they
went for the one market every one else was ignoring. The home user!
Texas Instruments and Atari battled it out for this market early on...
then came the C64. Next thing you know they all pulled out and left
the market wide open. Atari simply couldn't afford to secure it...even
thoe they gave it a try. At the time...the ST was the absolute BEST
machine on the market for its price. I was running DOS and windows
applications on my Atari, along with a great deal of Mac stuff (Both
faster than the native machines I might add!), and saving
my data to 3.5" floppys (two or three years later before this
became standard on PCs)...running in full color, doing midi work...
and much much more when my friends had paid up to 4 times the ST cost
for an Apple GS, an XT, or the occasional (very rich) Mac user (and
scraping to afford a simple MPU...let alone midi interfaces and sound
cards). Today...I can still use my ST with only 1meg and do things that
it takes a current Mac or PC at least 12meg of RAM and an awfully large
hard disk to accomplish. So maybe TOS/GEM is old and outdated...but
it's sure outlived the others when you consider it's only gotten four
or five slight modifications, and DOS/Windows/SystemX.XX is constantly
getting major plastic surgery just to make it useable.

Atari fell behind in technology?
Interesting that they hit the market first in many many areas...all the
way to the last product...the Jag. Falcons came out when Pentiums were
still a wet dream...In my opinion, Atari's big problem has never been with
the machines they made and their respective OS. Axe to the grind stone...
the Atari machines WORK with less problems than any other machine I've
ever come in contact with for average (and some not so average)

applications. It's really not fair to compare the latest stuff that just came out last year with stuff that came out 5 years ago (Falcon...longer for other Atari stuff)...and even so...the Atari CAN and DOES do most current computing needs. That's pretty good for a platform laid out in the early 80s!

The "few" dealers that carried Atari sold the hell out of them. The problem was that no one can see into the future. Trimmel was one major player who saw much success in making a good machine for cheap, and selling it in mass quantities (I.E. C64). He took a gamble with the same policy on Atari. The problem...by this time...free publicity was no longer existant like in the C64 days when editors lined up and begged to review the hottest new gadget. He didn't figure this into the equasion, and Atari no longer had money to push their lines. Furthermore, there were evidently some big jerks down in dealer support that managed to piss off the majority of local small Atari dealers...there went their last hope! Shortly, mail order and whare-house whole sale ruled the PC world. Now...I think it is basicly a matter of luck, and this time around Trimmel's seemingly logical move at the time lost. It easily could have gone the other way however...one never can tell...you make your best call and hope for the best.

Okay...are the Direct Computer Clones a good choice?
For a lot of applications...yes...
I doubt Direct Computers expects to sell a whole lot of these...espically to "home users". The people who will buy them are power users who might already have lots of TOS software. Or someone wanting to market a particular nich package based on the platform. For instance...
Say I'm a company who has been working on a project for the last ten years to make a machine to co-ordinate satellite uplinks. I already have ten years worth of code that was written in 68000 assembly language but just now are ready to select an existing machine to build the rest of the system around and go to market within the next two years.
I make a few phone calls...
I'm down to choosing between a Mac mother board, and the Direct TT.
Mac is all out of the particular one I need...the next model up that they will sell me without a chassis and other junk I don't need is going to run me about $1,000,000 more in the end, mainly because I have to get a special commercial liscence to resolve some crazy legal problem with software drivers for the networking card I want to use that'll zap a whopping %15 royalty for every unit, or upgrade I sell. Going with an Intel set up means rewriting all the software at the expense of 10 years of work and research. (these are hypothectical but realistic instances here...so please don't fire specific flames here).

I call Direct computers, and they say they can make a run of the exact number I need, hack off what I don't need, and add what I do, and even make a bid on doing my final chassis for the ENTIRE system if I want...my lawyers say we're good to go with developing or obtaining everything we need for the platform without running into problems...Etc..Etc..Etc.....the machine meets my specs...so I buy about

two thousand of them and contract to buy a whole bunch more over the next 5 years!

This will eventualy happen for Direct's TOS Clones if they hang in there and get some good sales people at hand to search out this demand. This kind of thing happens every day...I see enough nich hardware in the TV station I work in to know this is a fact. We've graphics systems that are based on VERY old technology...but they work better than anything else avilable. They are VERY EXPENSIVE...but the companies that made them have made decisions that most of us can't even imagine...usually resolving around legal and liscenseing issues. Believe me...if a company finds out they might be able to save a big bundle by going with TOS over some other system...they will do it! I've seen quite a few "industrial" computer manufactures pop up under similar circumstances to the TOS Clones at Direct TT. They've a good product on their hands...there's lots of applications that this machine is perfect for...and given a decent quanity to make a run of...it's very possible one could save big bucks going with the platform.

Oh, and by the way...Atari sold a lot more industrial computers than most realize...I've no idea how many...but every-where I go...I see these babys poping up in the strangest places!

Brian

Because it would have broken too many applications, and didn't seem
important enough when the competition was DOS.

>Attacking? Mere pointing out the fact(s).

Facts, you've got to be joking, you don't know anything about the
Atari of today. At least you admit you have no knowledge of it, it's
a start.

>> Well I'd never heared of that word and neither had my dictionary or my
>> Psion. I say there is no word at least not in the proper English
>> language, care to enlighten me?
>
>Try harder and use a different spelling..

The automatic correction offered no alternatives. It wasn't a case of
poor spelling Pete, it was a lack of knowledge. When words are typed
incorrectly the fall into a number of categories: bad typing
(virtually all of mine), knowledge errors, grammar and spelling. You
can't spell Rhapsody as Rhasopy or whatever the words sound nothing
like eachother, you thought that was it's actual name same thing with
Tempus/Tempo, you have absolutely no idea, I'm an atari owner and I
knew what the bloody things were called and I'm not the one promoting
them, if you try and advocate something, it does help to know what
they are called.

> Those things which need to be there are by no means 'many'.

You asked what cannot be written at the application level and I told you. I
am not claiming that any particular technology is best implemented in
supervisor code.

> Those that do are attempting to supplant big iron.

And doing it successfully. There is no reason to not run a program that needs
a few hundred megs of logical address space on a decent microcomputer using
a decent OS. I don't include the Mac operating system here.

> Howso? They both have to deal with the same locality issues.

VM has a lot of hardware support for keeping track of page faults and page
touch frequence/recency to pick victim pages. If you wanted to use that
information in a disk caching algorithm then you would have to do it
in software which would be much slower. Most "modern" operating systems
(such as NT, IRIX, UNIX) use a good hardware supported VM scheme and
a simpler disk caching scheme. Also remember that each time you read
something from a (non-memory mapped) file you are invoking a function that
will have a lot more overhead than simply accessing a memory address.

> That which is commonly used would be covered by MPEG.
> Even the rest which are often touted and less often seen
> would be covered by other formats (like vrml).

MPEG is a video format. QuickTime is a video engine. They are not directly
comparible. For example, it is logical to ask "Can QuickTime play MPEGs?"
(it can) but it is silly to ask "Can MPEG play AVI files?". QuickTime
adds a great deal of functionality to your computer. It allows you to play
back many animation and sound formats, it can control MIDI devices and it
can control video digitizers. This gives programmers a powerful API to
create multimedia applications. I wrote a digitizing program for the
Mac once and the digitizing component was only about a fifty lines long.

It was just a prod to get a response from the other two debating
the speed of their systems. I included the 10.2 second Falcon time
just for giggles. Tim has come back and stated that for his PPC
the time was 1.9 (I think) seconds for this file using Graphics
Converter. But, he didn't actually time it the same was as was
discussed. I may have missed what Chris posted.

While were here, do any of the 060 cards available for the Amiga
work with your A1200? I have considered lately looking into a second
hand unit as I have found some Toaster hardware that I can
get my hands on. I usually once a month pick up VTU, but it's
not the same as the old Amiga World. I have to "learn" about
the h/w by reading the dealer adds. Is it really necessary to
go with the 4000T or would a lower spec model work specifically
for the task of video capture and utilizing the 060 upgrade?

Sorry, I was actually talking about Tempus 2, I never saw the
original, I'm not sure if it was released here.

>I guarantee you that it is easily possible to write a DOS application
>which will whip the pants off of anything in scrolling speed.

It's a big shame that nobody has done it then, Tempus 2 will also run
in a multitaking environment such as Magic so thats a bunus too. Also
I wan't only talking about scrolling speed, it was just an example,
things like Search and replace are instant, a 2 meg file can be
re-formatted within a few seconds. Pound for pound a 601 at 90mhz or
any faster chip should really be able to absolutely blow Tempus 2 many
times over, however as you admit there may be something faster
possible but I would say there is nothing that is as efficient with
processing power as Tempus 2 and sadly I doubt there ever will be.

>The
>advantage Tempus 2 has over programs you have likely compared it to is

As you say, potential, the apps don't appear to exist and certainly
not on the more modern windowed, multi-taksing systems.

Quite right, memory is at an all time low, the latest prices are
unbelieveable, in the UK they have dropped more than 50% within the
last 2 months or so.

>> of these limits is not addressed by MagiC 4.0?
>
>Does it have VM? No?

VM is available on machines that have the power to support it with
utilities like Outside, it's not built into the OS as it is not
particularly useful, my machine has a mere 4 Megabytes and the only
time I see the out of memory dialog is when I'm using a utility that
does not dynamically allocate ram and I only have 2 of them.

>Well, that's an obvious start. Does it have much
>in the way of network support? No?

Not really, they were never really meant to be networed machines, it's
not useful in the case of the vast majority of Atari owners.

>Does it have memory protection? No?

Magic has very good memory protection, I've had quite a few crashes
but one that brings down Magic is a very rare sight, magic handles
errors very well.

>Sounds like a limitation to me. (Maybe things have changed, but in my
>Atarian days there was little to no support for any of these things, and I
>haven't seen evidence of them in my fiddling with MagiCMac.)

I'm not sure if MM handles things differently, I've not had a chance
to use it much yet.

>Does TOS have a 3D graphics API? Does it support hardware acceleration
>for it? MAJOR limitation. This is hardware of today we're talking about.

No need for it sadly the game sindustry on the Atari is all but dead,
that's why I bought a PSX.

Supply and Demand, it's a good machine, the machine is worth this to
some people, people who know about Atari systems will see it's true
worth although of course it would be nice if it was a bit cheaper, in
small quantities howver this is VERY difficult.

>> Tell me, what is a "3D appearance manager"?

Quite right, current trends are: Processor power doubles every year,
Memory density doubles every 2 years, disk capacity every 3 years,
seek rates double every 10 years.
At these rates by 2003 memory will be more efficient than disk
(including the price). Sounds good news to me.

>You were talking about MagiC. I assumed that MagiCMac is the same OS,
>just running on a Mac instead of an Atari. Did I assume wrong? I thought

>that's present in QuickTime?

No they just call the Quicktime application, it's not really a part of
the OS, merely a componens supplied with it by default.

I tried one of the benchmarks that was there, too (FPUTEST, which had C
source). Here's the results for my machine, along with the last few lines
of results already in the source: (times are in seconds)

5.39 25.54 Definicon 780+, 20 MHz 68020/68881 SVS C

5.12 23.75 Definicon 785, 25MHz 68020/20MHz 68881, SVS C

3.18 12.275 Atari Mega ST2, PAK3/030, 32 MHz 68030/68882,
Pure C 1.1 generating Inline 68881 Code

0.1053 0.1267 Apple Power Macintosh 7500/100 upgraded to 604/155
No L2 cache
CodeWarrior 10 with max 604 optimizations

(The lack of a L2 cache probably doesn't hurt me on this one, since I
suspect the code and data both fit into the L1 processor cache.)

>I forget now, but either Graphics Converter or DeBabelizer allows you
>to choose Quicktime or not.

GC does have its own decompressor. I tried it, and it's slower than the
QuickTime code.

>Yea, the hardware is bitchen. I just like the simplicity of TOS or
>MagiC.

I really think you should check BeOS out, then. It is simplistic, but
less so than TOS or MagiC. And it is very, very fast. If you can get
hold of a copy of the January MacTech magazine, it has a CD with BeOS
DR8.2 for PowerMac that will run on any PCI PowerMac.

I've had crashes with it, situations where something goes obviously wrong
that prevents the system from responding. But it is pretty stable for a
"developer release", on non-Be hardware. I won't be running it as my main
OS, but I am seriously thinking about keeping it as a cool OS to hack
under (it is very easy to write multithreaded windowed apps in BeOS -- you
practically can't avoid writing them that way).

Quite possibly not. You don't have to worry about eking every last bit of
speed out of a PowerPC to get a responsive and fast word processor.

Interestingly, WordPerfect for PowerMac may be partially assembly. There
is a company that offers 68000->PowerPC and x86->PowerPC assembly porting
tools and services. They list WordPerfect as one of their major
customers; apparently much of it was originally written in 68K ASM and
they made use of the porting tools to transform it into PPC ASM. I doubt,
though, that very much of it would be written in ASM if they wrote it from
the ground up today.

How about a simple implementation where the OS simulates the failed read/write and gives the app the data, and then passes some sort of "you've done something bad" message to the app, along with details of what it did? This can, I believe, give a smoother transition into full memory protection later.

Oh, and the competition for the Mac was the workstation market - or at least that was how it seemed to me at the time. The Plus and other low-end models were the ones targeted at SOD.

The issue with memory protection is all the system globals in low
memory. It's tough to prevent an application from mucking with
entries for another process or the system.

Remember, too, that in those days, A/UX was thought to be Apple's
entry into the workstation market. They didn't sell enough copies to
keep that product alive.

|> Oh, and the competition for the Mac was the workstation market - or
|> at least that was how it seemed to me at the time.

Not me. I was in a technical group, where the primary product was
technical info. Lots of Macs, a few PCs, and some windowing
terminals. Almost no workstations.

|> The Plus and other low-end models were the ones targeted at SOD.

From mid-86 to mid-87, the Mac Plus was the _high_ end...

OK, stopwatch time for ab.jpg from your FTP directory, once the file is
loading from cache instead of disk, is 1.6 seconds. That's from the time
when I double click the file to the time GraphicConverter actually
displays it. Performance is the same if I put the file on a RAMdisk.

Yes, but yours is still an interesting time, since it is more at the level
of the usual user.

: While were here, do any of the 060 cards available for the Amiga
: work with your A1200? I have considered lately looking into a second
: hand unit as I have found some Toaster hardware that I can
: get my hands on. I usually once a month pick up VTU, but it's
: not the same as the old Amiga World. I have to "learn" about
: the h/w by reading the dealer adds. Is it really necessary to
: go with the 4000T or would a lower spec model work specifically
: for the task of video capture and utilizing the 060 upgrade?

There is the Blizzard A1260, which works well (AFAIK) in a standard A1200
(No heating problems, which the 040 boards often have).
The Toaster is, to my knowledge, still a card you put in the video bus,
which only the big-box Amigas have, the 2000, 3000 and 4000, unless you
upgrade your 1200 with an expensive Tower and bus solution.
If you don't need the Toaster specifically, there are other frame
grabbers, such as the Vidi-Amiga and V-Lab.

The 2mb/sec was a built in feature Atari provided:(. The IDE however
is not limited in this way. On my machine, depending which driver and
drive is connected, speeds upto ~3.8mb/sec are possible depending on
how your drive is set up and your cache options. The speed also seems
to float with the bus speed, but i'm running standard Mhz so I can't
really say what it tops out at (yet).

No PowerMac at home. At work we can only use "approved" O/S's and i'm
not sure the Gov has made a statement on this yet. I have to run MagiC
off my EZ135 at work to be "legal".
>
> I've had crashes with it, situations where something goes obviously wrong

I play with imaging to much to be considered an active beta tester:).
The Mac and two Falcons are usually busy "processing" which leaves me
my 36MHz 68000 Mega ST :).

Yes, thats a no no. It tends to speed things up:).

>QuickTime does so it is best considered a part of the operating system.

Has the bug in QuickTime been fixed where it causes some digital
video apps data stream to be inverted? I still notice it when
converting a QuickTime file to MPEG format at times.

I've several original boxed, unused Atari games (including some of those
below) that I'm trying to sell. If anyone's interested, a comprehensive
list, (including postage incl. prices - within the UK) can be viewed at:

http://www.polyprss.demon.co.uk/atari.html

those also fonts at /fonts.html and clipart at /clipart.html

feel able to browse at leisure. Or email for whichever list(s) you'd like
to see.

Regards

Kevin

Final Notice: IEEE's COMPCON 97 Set for Feb. 23-27 in San Jose

Visit the COMPCON 97 World Wide Web page for more information and/or to
register:
URL: http://www.compcon.org

or read the following :)

SAN JOSE, Calif., -- One of the country's pre-eminent computer
technology conferences -- Compcon 97 -- will be held
February 23-26, 1997 here in the heart of the Silicon Valley.
This continues a tradition of more than 40 successful years in the San
Francisco Bay Area for this non-profit technical conference.

"Hot Systems/Cool Software" is the theme of COMPCON 97, underscoring
the importance of new computing technologies and applications in both
the computer industry and society.

"Computer technologies ranging from world-record 600MHz processors to
eye-catching Java applets and VRML virtual worlds will all be featured
at COMPCON 97," said Darrell Long, the conference chair and computer
science professor at University of California-Santa Cruz. "COMPCON
has the reputation as a one-stop, no-hype overview of the important
developments in our industry. If you could only attend one technical
conference a year to learn about the overall state of the industry,
COMPCON would be your choice."

Adds Dr. Joel Birnbaum, Vice President, R&D and Director of HP Labs:
"COMPCON has been consistently a valuable conference presenting a
broad technical program on state-of-the-art computing technologies."

IEEE COMPCON 97 will be held at the San Jose Hilton
and Towers Hotel (300 Almaden Blvd.) in downtown San Jose, Calif.

COMPCON is sponsored by the Institute for Electrical and Electronics
Engineers (IEEE), a non-profit professional association, and has been
held in the Bay Area annually since 1955.

Its 27 technical sessions and six in-depth tutorial topics run the
gamut from the design of advanced central processing units and
networks to computer systems, advanced programming and world wide web
technologies. In addition, five well-known industry luminaries will

give plenary talks. COMPCON has no marketing presentations or product exhibitions.

COMPCON 97 program overview:

INTERNET/INTRANET TECHNOLOGY: Trends, Environments, Applications

SYSTEMS: Superservers, Mobility, Software Architecture

MICROPROCESSORS: High-Performance, Low-Power

INTERCONNECTS: Parallel Computers, LAN and WAN, Wireless

VIDEO: Advanced Displays, Digital

MULTIMEDIA: Technologies, Software Environments, Applications

PARALLEL/DISTRIBUTED SYSTEMS: Applications, Hardware, Compilers

OPERATING SYSTEMS: Object-Oriented, Microkernels

PERIPHERALS: Mass Storage, DVDs, Display Technologies

EMERGING TECHNOLOGIES: GigaHertz Devices, Advanced Hardware, Java

Tutorial topics include: 3-D graphics, virtual reality, web site design and security, advances in computer architecture.

Plenary speakers include:

Federico Faggin (Synaptics) -- "The Microprocessor: Its History and Future"

Hector Garcia-Molina (Stanford) -- "Meta-Searching Across the Internet"

David K. Gifford (MIT and OpenMarket) -- "The Future of Electronic Commerce"

Ted Laliotis (Laliotis and Associates) -- "To Tax or Not to Tax Internet Transactions"

Dave Nagel, AT&T

Advance reservations to Compcon 97 can be made through the web site or by contacting:

Dave Hunt, COMPCON 97 Registrar
Lawrence Livermore National Lab
PO Box 808 MS L-130,
Livermore, CA 94551-0808
E-mail: hunt-dn@llnl.gov

: You're really exxagerating the performance hit quite well. I congratulate
: you on your use of polemics.

: In reality, VM performance hits are not the step function you suggest.
: You do not go directly from 100% performance to 5% or worse. There are a
: large number of situations where VM is active without impacting
: performance much at all. Sure, if you get your computer into thrashing
: behavior, performance will go to hell, but that's a characteristic of any
: caching system. Modern computer architecture is all about memory
: hierarchies and avoiding thrashing behavior between the various levels.
: VM is no different.

: >>server to have decent performance, you must put enough RAM in it so that
: >>it doesn't have to swap often, or else users will complain that the
: >>machine is a slug).
: >
: > Two words: Resin Fire.

: And what the hell is that non sequitur supposed to mean?

: Oh, wait, I get it. You're trying to make an obscure and clever reference
: to the scare that artificially inflated memory prices a while back.
: Unfortunately, as a response to the point I was making, it falls flat on
: its face.

: >>So what's your point? That we should stay mired in the backwaters of
: >>computing just to be absolutely guaranteed that a disk swap operation will
: >>never happen?
: >
: > So? How is TOS a backwater? One has yet to address that. All you
: > MacVocates can come up with are application level toys.

: Ah, so now I'm a MacVocate. Funny, I don't seem to recall this thread, or
: at least my participation in it, being about the Mac for quite some time
: now.

: For the record, I have many beefs with the MacOS. I own a Mac, partially
: because it's the last hope for non-Wintel personal computers, but I am not
: uncritical of it.

Well,maybe with Linux it's useable...

: > However, since Petey-Boy himself seems to think that the OS is just
: > a pathway to the apps,

: I don't care what Peter thinks. You're not arguing with Peter. You're
: arguing with ME.

: > then great OS sophistication really isn't
: > required. There is little that MacOS or Win95 has that cannot be

: > then it's a problem.

: Your postings get more bizarre each time.

: Running out of memory has nothing to do with the OS in question. It's a
: matter of using the memory for programs. If you crank up enough of them
: you will run out. If you run a single program that needs more than you
: have free, you will run out.

: >>I would be very surprised, based on your postings, if you had much of a
: >>grasp of computer architecture. If you do, you sure aren't using it.
: >
: > I have enough to know that SCSI fast wide (or even RAID) doesn't quite
: > compare to multiple IO channels or solid state disk.

: Um, you just demonstrated that you can masterfully make a dumb
: comparison. Big machines might have multiple I/O channels for a RAID --
: what do you think each of those channels is? Very often, fast/wide SCSI.
: You can buy dual-channel UltraSCSI cards for Macs; they're intended mainly
: for RAIDs. (Single-channel RAIDs are possible, but not as fast.)

: > Furthermore, such knowledge really isn't required. All that I have
: > said can be demonstrated empirically with no technical understanding
: > needed.

: First you say you have knowledge of computer architecture, as a way of
: trying to bolster your argument, now you say you don't need it. Make up
: your mind.

: >[deletia]
: >>You're really exxagerating the performance hit quite well. I congratulate
: >>you on your use of polemics.
: >

: > Then I challenge any interested parties to test for themselves.
: >
: > 8ms is a lot faster than 150ns no matter what kind of spin you
: > try to put on things.

: Strange that people don't use hard drives instead of DRAM, then.

: OK, that's a cheap shot. I'll give you the benefit of the doubt and
: assume that you really meant to type it reversed. Simple mistake,
: everybody does it.

: However, you should really look at VM in this light: VM is like having a
: large but very slow memory cached by the computer's DRAM. The computer's
: DRAM is in turn cached by an external "L2" cache, which is in turn cached
: by a internal CPU cache. Ultimately, the CPU keeps data it is currently
: operating on in extremely fast registers. Each level in this memory
: hierarchy is much slower than the one which preceded it. The idea is to
: avoid too many misses so that fetching from the next slowest member
: doesn't happen often.

: The reward is that if the miss rate is kept down, you can make a slower
: but cheap memory perform almost as well as a faster but more expensive
: memory. The techniques for reducing miss rates are well known and are the
: subject of intense research by computer architects. Although the
: techniques used for caches are somewhat different from those used for VM,
: there is a striking amount of similarity.

: Furthermore, both systems have breakdowns. Just as VM can sit there and
: grind the disk continuously, L2 cache can exhibit thrashing behavior which
: makes the system perform worse than it would without any L2 cache.

: In both cases, though, the benefits are too good to ignore.

: >>And what the hell is that non sequitur supposed to mean?
: >
: > It means that some of us have been doing this for awhile and
: > have actual empirical knowledge of the subject that trumps
: > quite a bit of what academia may be feeding you. It's a shame
: > they don't quite feed you enough.

: Ah, an anti-academic. If you can't win an argument, try to paint the
: opponent as living in an ivory tower.

: >>Oh, wait, I get it. You're trying to make an obscure and clever reference
: >
: > Amongst memory consumers, the reference is by no means obscure.

: I am a memory consumer who was hurt by the incident, yet it took me a
: while to remember.

: >>to the scare that artificially inflated memory prices a while back.
: >>Unfortunately, as a response to the point I was making, it falls flat on
: >>its face.
: >

: > Money is never irrelevant.

: So you're trying to say that because RAM was excessively expensive for a
: while, virtual memory is bad? Sorry, either you're gibbering, or you're
: trying to sidetrack from the issue of whether VM is a Good Thing.

: > Perhaps this is the reason Mac is in its
: > current state. When I got my first ST, you could buy a new car for
: > less than some Macs. They're trapped in an academic mentality and
: > aren't capable of real engineering.

: The fact that Apple had models in the 80's which initially retailed for
: more than $5000 (some were closer to $10000) does not mean that they had
: an "academic mentality". It means only that they were targeting a much
: different market than Atari. IMO, it was a mistake for Atari to ignore
: that market, since targeting it would have given the ST much more
: credibility as a serious computer, as well as ensuring that Atari kept up
: with current technology instead of falling far behind like it did.

: It was also a mistake for Apple to ignore the low-cost market until recent
: years. There is no rule that says you cannot design a machine which is
: easily scaled to several levels of price/performance.

: > We are just fortunate that RAM doesn't impose the same kind of
: > constraints that it once did. To believe that it never will again
: > to the same extent is grossly naive.

: In the long run, RAM will get cheaper and denser. This is a very
: non-naive idea based on knowledge of what goes on in semiconductor
: manufacturing. The price scare of a few years ago and the current low
: prices are symptoms of a commodity market. But nothing will change the
: fact that roughly every 1.7 years (if I remember correctly), DRAM density
: quadruples. This is a rule which has held true for 20 years or more.
: It's why I paid $50 or so for 256K of RAM to upgrade my 800XL in the 80's
: and paid $90 for 16 MB of RAM a few months ago.

: >>There are many things which cannot be grafted at the application level.
: >
: > Like What?

: Like anything which needs to be global and standardized. You could try to
: graft something like UNIX pipes onto programs at the application level,
: but it wouldn't be nearly as good as if it were done in the OS itself.

Why not just put it in a seperate programme and then everything accesses
that programme?

: >[deletia]
: >>Does it have VM? No? Well, that's an obvious start. Does it have much
: >
: > It's a poor start. VM is not at all necessary. In microcomputers,
: > it only serves to allow developers to be immensely sloppy.

: How is it sloppy to be unable to anticipate that J. Random User will try
: to run fifteen programs simultaneously on his 4 MB Mac LC? Each of those
: programs could be as tightly coded as possible and J.R.U. would still run
: out of RAM.

I think the point is that developers wouldn't try as hard to optimize.

: I really think you're pulling this out of your hat. Most developers have
: to try to code for the lowest common denominator. That automatically
: includes trying to avoid dependence on large amounts of memory being
: present. As the average user gets more and more memory, developers set
: the bar higher and higher, but in no case do they just sit around saying
: "hehe, let's make our software a pig, we don't care, we don't have to".

: Some developers are clearly much worse at efficiency than others. For
: example, Microsoft Word 6 for the Mac is an insufferable pig, both for the
: CPU cycles it burns and the memory it eats. The user reaction was to dump
: it, something which was probably a factor in Microsoft's recent
: announcement of its creation of a new Mac product division which will
: develop Mac products from the ground up. (As opposed to the current
: policy of doing poor ports from the Windows versions.)

: > Memory Management would be a much better 'modern' requirement.

: Define "Memory Management".

: >>in the way of network support? No? Does it have memory protection? No?
: >
: > Actually, MagiC does. Network support can exist on the application
: > level and has been existent on the ST's for quite some time.

: Network support needs to be an OS service. It is too much to ask every
: application developer to reinvent the wheel.

Why not make it a server like a FTP server.
I have a programme called "WHATIS" on the ST,and I can just type
"WHATIS *.*"
to find out what type of file (BASIC,ML,picture...) each file in the
current directory is.I can also access it through the accesory menu.
The point is that ALL programmes can talk to WHATIS if it's made resident.
They can ask it "What does this header mean" and so forth.
Even if it couldn't be made resident,they could still run on a file
everytime they need to know.(like UNIX)
Doesn't Mac have inter-process comunication?

: MiNT/MultiTOS probably have at least a TCP/IP protocol stack, but there
: seem to be very few people that use those particular offshoots of TOS.

: It is always very funny to see the extremist Atari advocates gloat about
: the LocalTalk compatible port on the Falcon. They never mention the fact
: that Atari didn't have an AppleTalk network driver (and, to the best of my
: knowledge, nobody outside of Atari has ever written one either). A
: network port without the software to support it is worthless.

: >>Sounds like a limitation to me. (Maybe things have changed, but in my
: >>Atarian days there was little to no support for any of these things, and I
: >>haven't seen evidence of them in my fiddling with MagiCMac.)
: >
: > I'll consider this methodology the next time I fire up the PC
: > Mac emulator: Executor. '-p

: You were talking about MagiC. I assumed that MagiCMac is the same OS,
: just running on a Mac instead of an Atari. Did I assume wrong? I thought
: that was the idea behind MagiCMac.

: >>Does TOS have a 3D graphics API? Does it support hardware acceleration
: >>for it? MAJOR limitation. This is hardware of today we're talking about.
: >
: > API's are all applications level.

: You have an odd definition of "application level". Usually it refers to
: code that sits in an application instead of in an OS. An API is the
: interface offered to an application for an OS service.

Or it could be in a shared library.Or simply a small programme that
everybody(programmes) run that most all have.(like grep in UNIX)

: > Although 3D hardware acceleration would be a nice addition.
: > However, this could also be added to TOS with no problems.

: That doesn't change the fact that it's not there.

Well a infinite number of things aren't in there.

: >>Does TOS have anything like QuickTime?
: >
: > For those parts of QT that actually get used: yes.

: What parts do you think don't get used?

He probably means the part to put graphics on the screen,as opossed to the
part that de-codes the MOV file in to said graphics.

: > Although, this is applications level as well.

: Is it? Is it practical to expect every developer who wants to include
: digital motion video in their program to reinvent all of the technology
: that's present in QuickTime? QT means that programmers can easily
: implement fairly advanced features in their programs with minimal effort.
: It means that you don't have to worry about interoperability with other
: digital video programs, because if you use QuickTime you automatically get
: it. Just as an example, you can cut, copy and paste chunks of video using
: standard Mac clipboard operations between any two apps which support
: QuickTime.

: This would be extremely impractical to do at the application level.

Once again,doesn't the MAC have IPC?
(or shared libraries)

>uh,what does 3D graphics have to do with anything?
>That's really a driver-level task.(or shared library)

Actually, a layered approach is best when considering 3D graphics. The Mac
has the following layers:

QuickDraw 3D (shared library)
RAVE (shared library)
RAVE driver (driver)

The idea is that the application programmer gets a nice highlevel API
without having to worry about how the scene is actually being rendered.
As far as I know, TOS does not include a highlevel (or any level) 3D graphics
API.

>Isn't QuickTime a thing like PC's AVI files?
>I don't see what animation has to do with OSes.Do you know what TOS is?

QuickTime is not a file format, it is a multimedia engin.

>Why don't you mind your own business...

I will explain this in small words, so that the other janitors at University of Northern Iowa can translate it to whatever dialect of simian ASL you understand.

Your spamming costs me money. Notice my email address on this post; I pay for my Internet access, and for my entire domain's access. Therefore, your spamming IS my business. Your sysadmin has basically said he doesn't give a shit - but if this continues, I'll ask Chris Lewis to get involved, and then your sysadmin WILL learn to give a shit, becasue Chris Lewis is capable of convincing all other admins (or a significant percentage of them) to UDP the uni.edu domain for spamming. That would be greatly inconvenient to the University adminstration and students. Eventually, the source would be traced to you and your buddy in whatever uni.edu calls the information technology department.

Is that simple and clear enough?

Followups set, as usual.

See below.

>: Does TOS have anything like QuickTime?
>
>Isn't QuickTime a thing like PC's AVI files?

No. AVI is just a simple movie format. QT is a generalized format for
data played over time (QT tracks can contain all sorts of different
things). QT is also a complete set of operating system calls to manage QT
data, so that if you are a programmer, you don't have to worry about the
details of it yourself.

>I don't see what animation has to do with OSes.Do you know what TOS is?

Yes. I owned a TOS computer for several years.

In this day and age, a personal computer operating system is expected to
provide a wide array of services above and beyond the basics (memory
allocation, process management, file systems, and basic I/O).

BTW, next time you reply to something, please trim the parts of the post
you aren't responding to.

The Falcon was not a "first". Atari talked about it for an awful long time before actually releasing it, and by the time they did, it was no longer a blockbuster product. You could spend a couple hundred more to get a Mac Quadra 660AV, which had a lot better hardware overall than the Falcon. (I'm not sure that the Quadra was released prior to the Falcon... but NeXT had a 56000 series DSP onboard *long* before the Falcon.)

The ST was not a first. It was clearly a followup to the Mac: offer a cheap GUI alternative to the Amiga and Mac (both of which were more expensive than the ST).

The TT was not a first. 030 machines existed long before Atari finally got on the bandwagon.

Atari was behind the technology curve throughout the Tramiel years. The Jag is possibly the only exception, but they killed it with the trademark Atari cheesy support and marketing.

This is probably not something I should butt into, but Rich says something that is simply not correct, during the process of flaming Peter Sinclair-Day for "spamming" comp.sys.atari.st:

In article <5cdt3e$dmq@ornews.intel.com>, postmaster@atarinet.portland.or.NO.SPAM.us (Rich Tietjens) wrote:

>I will explain this in small words, so that the other janitors at University
>of Northern Iowa can translate it to whatever dialect of simian ASL you
>understand.
>
>Your spamming costs me money.

No, it does not.

When a news message is crossposted to several groups via the Newsgroups: line, only one copy of the post is sent. The various news handling software packages, so far as I am aware, are smart enough to not require duplication at any point. It is therefore untrue to complain that crossposts into comp.sys.atari.st cost you money. The most it costs you is visual clutter in the newsgroup, which would be a valid complaint. Most people address it with killfiles (which in the long run would be the best way to get rid of Peter, or me if you happen to harbor a dislike for my scribblings).

Your conception of what entails spamming seems to be rather different from most other people's, by the way. Having a few too many newsgroups included in the header is different from intentionally trying to shove your message into every group possible.

I personally feel that the threat of cutting Peter's entire uni.edu domain off was excessive, rude, and an obvious attempt at bullying him into submission. Peter is annoying, but he is incredibly well-behaved compared to the sort of people who have gotten entire domains nuked in the past. Only an extremely objectionable act can justify cutting off thousands of users just to get at one offender and an uncaring sysadmin.

I could of sworn that there were several librarys available to TOS and
MagiC programmers that deal with 3D interface. Take a look in the Falcon
archives on CNAM. Face Value is kind of nice to.

I have Video Master Falcon, and for a while had the
Expose card from Titan. The Expose is quite the performer,
I just wish I could get an NTSC version. On my Quadra 900
I have an old Radius Spigot. On a good night I can capture
about 17fps at 240*180 but the Quadra is so damn slow at
editing. I usually save out the frames as .TGA's and load
them into Apex Media on the Falcon for a more user friendly
enviroment and faster processing. The Radius has ok quality,
but falls a little short to what I was getting with the
Expose card. At work I have a Quadra 840 AV with a video
compression card by Radius. It will capture 640*480 at 30fps
but the quality is crap, and because of limitations with
the Mac you can only view your work in 16bit color depth
while working with the input or raw file.
I checked out the price to upgrade an Amiga to one of
the Towers your talking about. Not cheap:). I'll look
around the local recycler (www.recycler.com) for a good
price on a 2000.

Sorry about pulling the ab.jpg file. It didn't seem that
there was much interest in the test at the time.

I was looking through the Apple Tech Lib and saw a some bits
about a few MIDI apps where the programmer didn't seem to want
to use the perfered method by Apple to access the serial port.
That is what "Serial Switch" is for isn't it? I kind of though
they probably programmed it that way for improved throuput during
playback.

I first noticed this when using Sparkle. It was after reading the
docs that I became aware of the "bug". I do use QT 2.5 so I guess
it's still there.

I didn't try loading it on the Falcon with the CPU doing
the work. The time would probably be close to what your
getting on the Amiga.

Hopefully Frank or Magnus read this and try the file
on their Afterburner Falcon 040's. THAT would be
interesting:).

The 50MHz 040 I have has 128K CPU cache and the card plugs into the PGA
socket. I removed the card as the PDS slot (where the DOS card is
installed)
does not function with the 50MHz 040 card (at least the DOS card dosen't
work). DiiMo no longer exist but the same card is available under a
different
name by MicroMac.

I thought that "Serial Switch" was meant to fix problems when a program tries to execlusively control the serial port. Anyway, the point is the same.

But it does... Let me explain... My ISP doesn't have an "unlimited" option,
so whenever I have to take extra time to download his drivel, its causing
me to spend more time on the 'Net. More time = more cost to me. Period.

Haven't tried a "killfile"... Can I do that with Oasis v1.35? Might be nice
to send his messages to Limbo. Of course, he'll do like he usually does and
E-mail me with some useless friviality... (and then I have to reply 'cause
I like burning him-its so easy) :^)

Many microkernel operating systems implement the *file system* as a user
mode process. Does this mean that the file system is no longer part of
the OS, just because it doesn't execute in the kernel address space or
supervisor mode?

QT is in fact a set of shared libraries. Nonetheless, it is a service
offered by the Mac OS to application programs. The main reason QT is
implemented that way is so that it doesn't needlessly occupy memory while
it isn't being used.

>: BTW, next time you reply to something, please trim the parts of the post

I really haven't the faintest clue. PICO is nice and easy to use, but it
seems to be deficient in capabilities. Not that I'm a wizard with UNIX
text editors; I refuse to learn vi unless I really have to and I know just
enough EMACS to get by.

: > (No heating problems, which the 040 boards often have).
: > The Toaster is, to my knowledge, still a card you put in the video bus,
: > which only the big-box Amigas have, the 2000, 3000 and 4000, unless you
: > upgrade your 1200 with an expensive Tower and bus solution.
: > If you don't need the Toaster specifically, there are other frame
: > grabbers, such as the Vidi-Amiga and V-Lab.
:
: I have Video Master Falcon, and for a while had the
: Expose card from Titan. The Expose is quite the performer,

I haven't heard of expose, but I know of the Videomaster, which is also
available for A500 and A1200, though it does not seem much cop, if I have
understood you requirements right.

: I just wish I could get an NTSC version. On my Quadra 900
: I have an old Radius Spigot. On a good night I can capture
: about 17fps at 240*180 but the Quadra is so damn slow at
: editing. I usually save out the frames as .TGA's and load
: them into Apex Media on the Falcon for a more user friendly
: enviroment and faster processing. The Radius has ok quality,
: but falls a little short to what I was getting with the
: Expose card. At work I have a Quadra 840 AV with a video
: compression card by Radius. It will capture 640*480 at 30fps
: but the quality is crap, and because of limitations with
: the Mac you can only view your work in 16bit color depth
: while working with the input or raw file.
: I checked out the price to upgrade an Amiga to one of
: the Towers your talking about. Not cheap:). I'll look
: around the local recycler (www.recycler.com) for a good
: price on a 2000.

Well, the 2000 seems a good choice if you are willing to upgrade it. There is the A2060 060 accelerator for the A2000 from Phase5, and it has slots to contain anything you can point a stick at.
The video ports of the Macs something I am very impressed with, however. Definitely an advantage over the PC for Macs. The PPC Macs are quite nice machines, but it's ridiculous that one needs a 100 MHz+ RISC processor just to have an acceptably fast environment, but now I can see the letters on screen as I type. =)

: Sorry about pulling the ab.jpg file. It didn't seem that
: there was much interest in the test at the time.

I have it up at http://www.canit.se/~optimus/pix/ in case anyone wants it. Hope you don't mind.

I was thinking along the lines of 1989-ish, as that was when I started to become Mac-aware. (I believe that 1989 was named "Year Of The CPU" in Mac circles as each new machine was bigger/better/faster than the one before it). And that A/UX was reviewed as Apple's push towards the workstation market - "a full Unix, with a Mac user interface" or similar. But that was from a PC mag from the long-gone time when PC mags covered Amigas, Ataris, Macs, Intel-based PCs and other different computers in the same issue.

: >No they just call the Quicktime application, it's not really a part of
: >the OS, merely a componens supplied with it by default.

: Applications should not directly access the computer's hardware. QuickTime
: does so it is best considered a part of the operating system.

Whether or not applications should directly access the hardware is a question which isn't likely to be answered any time soon.

There are two points of view:

1. Applications should directly access the computer's hardware. This allows maximum performance with minimal interference from the OS (which can slow things down) and minimal overhead inside the OS (because it need not support the hardware, it only need support the driver and direct access). It does leave large security holes if implemented incorrectly (e.g., an application could scribble on the kernel), and doesn't allow effective use of multiple graphics applications at the same time.

2. Applications should never access the computer's hardware, they should tell something else to. This allows maximum security, because driver for the card controls everything that is done with the card. It also allows the use of multiple graphics applications at the same time (like running two X clients at the same time). It does add overhead because the driver must be called each time something is done and also adds time to the development of the driver.

How does this apply to Quicktime? Well, QT access the hardware directly (according to Brian; I'm not familiar with it myself). This could make it a part of the operating system by definition 2, because that definition disallows the possibility of something accessing the hardware directly and not being part of the OS. But by definition 1, it could be a user space driver, because they don't have to be part of the OS.

Whether or not it is part of the OS or simply a user space driver is to be decided on your own, but just because something accesses the hardware directly doesn't automatically make it part of the OS.

And the Mac was a follow-up to the Lisa. As I recall, the ST shipped before the Amiga, making it the first color 68000-based machine. The 1040ST was also the first 1MB computer to retail for under $1,000.

I don't really think you can say any 1 computer was truly first. Many computers--back in the days when choice was an option in computing--qualify as first in one area or another.

Mission critical application. Atari ST. Intersection is the null set.
If you have a real mission critical application, you don't buy an Atari
(mine for instance needed to be bent back and forth a few times every
month or so to keep it working, or the pins would touch the RF shield and
short out).

> IIRC the Mac has had '030 models since 1989 (the IIcx and SE/30 were the

The IIx was the first 030 model actually, and there are many reasons,
the main one being that they ran what was essentially the same OS as all
the rest of the machines.

At least from a UNIX point of view.I didn't think they had libraries on
the Mac.(unless you're counting the "resources")

: >How would I delete more than a single line with PICO!?!
: >(PINE's editor)

: Change the editor to vi.

How do I do that from Tin 1.2 PL2?

I always wondered why sysops never wanted you to have access to vi.
I assumed it was because they didn't want you shelling to DOS,but it
seemed to me that changing the "SHELL" varrible to "/bin/true" (or
whatever) would keep vi from running "sh".(or whatever)

Of course I don't know if there's anything that would keep you from
writing out the file to a different name.

You could have the BBS (or Gopher,in my case) run vi as a user-id that has
no meaningful access,but with the same group-id as the edit-file.
(which would have the user-id of the BBS)
Then,even if you could hack your way to a shell,it would be pretty damn
useless.

As I pointed out before, many microkernel operating systems (including
microkernel variants of UNIX) implement their file system as a user
process. By all reasonable definitions, the file system is part of the
operating system. The address space and CPU mode a piece of code run in
do not determine whether it is part of the OS or not.

Mission critical to musicians playing live before an audience.

Mission critical to the free world by stopping the Politically Correct
computer from dominating the globe, and people standardising on SOD and
Widows.

Mission critical to...

You get the drift.

> If you have a real mission critical application, you don't buy an Atari

That was probably just your machine.

Those I've known/used have worked out of the box and kept working until I
used them as a trade in on the next one.

Thanks. I'd forgotten about that one. Looked like a Mac II, and later the
IIfx had the same case IIRC.

: Technologies and did so to stick it to Apple.

[Lots more snipped]

What I would love is for someone out there with the brains for it to pick up what's left of Commodore and Atari Corp. and put what was the best of them together and go from there.

Both of these companies have a lot in common. Both of them had some good ideas ahead of thier time that could have really taken off, but human nature being what it is, intervened and they fumbled, allowing the likes of Microsoft, IBM and Apple to pick it up and run with it.

Commodore's biggest success was the Amiga. It should have prospered for years to come, but only snatched defeat from the jaws of financial victory. The same holds true for Atari. They could have been a winner with their ST line of computers, the Falcon and the Jaguar game machine, but instead they filed for bankruptcy.

I guess I'm just a little naive, as I type this into my Amiga 2000 late in the Los Angeles morning, with a dead Commodore 64 and Atari 2600 taking up space, and lots of old Atari VCS and 7800 games about. Isn't there anyone out there with enough foresight and imagination? Someone who sees these innovations for what they are, and what can be done with them? Hardly anything from either Atari or Commodore ever completely realised its true potential. I guess what I'm saying is we could really use a white knight about now.

I'm not going to hold my breath, though.

It's been a while, so forgive me, but isn't MiNT something you install on *your* machine? IE, it doesn't protect other people.

> That was probably just your machine.

Actually it was a well known flaw, so well known that Atari magazines of the day referred to it as the "Atari twist" and various success stories about it's efficacy appeared time and time again in the letters to the editor section (some of them rather dubious of course).

The problem with it was that doing it more than a few times would slowly work the ROM's out of their sockets, resulting in the eventual unbootability of the machine. At this point you'd have to take it apart and reseat them by hand.

And more to the point they were just plain junky. Cheap moldings for little strength (my mom dropped my old II down the stairs, it worked as soon as she got someone to plug in the video card again), tin foil RF shields, and the worst keyboards I ever used on any machine.

Not that there's anything wrong with that, they were selling into the C64 market after all, but that keyboard was unforgivable (notably when you use a Mega, which had a very good one)

> Thanks. I'd forgotten about that one. Looked like a Mac II, and later the

Quite right although I don't recall Rich posting to just the advocacy
groups of late but seeing as there is just one major cross-posted
thread there, this is not surprising.

>
>Your conception of what entails spamming seems to be rather different from

Yeah, the meaning of Spam is regularly being widened to include many
things. This falls under the "off topic crap" banner.

>I personally feel that the threat of cutting Peter's entire uni.edu domain
>off was excessive, rude, and an obvious attempt at bullying him into
>submission.

Also a threat I would think was as idle as very idle thing. Not
through lack of trying, I'm sure Rich would do his best to cut off the
domain but I somehow doubt off topic postings to a single group (and
not entirely off topic) warrants the cutting off of an entire
university! I don't know anything about this person you know (Chris
Lowe?) but if he has these sort of powers then I really hope he isn't
the pedantic fuckwit you imply him to be and I'm quite confident that

he isn't.

I would like to make it qite clear that this does belong in the
advocacy groups and this is the only posting of many on this thread
that I have also cross-posted to the general group so appologies for
this being off topic.

I assume that you use Oasis with NOS? I don't know if it works with
anything else so I'll assume you do. If you ftp to:
ftp.demon.co.uk/pub/atari/ka9q
There is another directory in there (I dont recall the name, but it
implies it was written by someone else). In there you shall find
NOS_POP3.ZIP, this version of NOS is exactly the same as 0.42 which
you probably already have but: It also has support for POP3 email and
the killfile bug has been fixed. Look around for a NOSFILES.LZH and
this will give you instructions on how the killfiles work, it should
be in the ka9q directory. If you need help then give me a mail. And
you can also bounce his emails if you like, you can just put his email
address into a file called MAILKILL in the Oasis directory and when
Demon tells you you have a message from him Demon will kindly
"return to sender".

Well sports fans, it's time to start a new thread here.

I just picked up the March issue of Mac User(Cover: Whats Next).

Had a review with screen shot and rating of the Steinberg Cubase 3.0 VST. Recieved a four mouse rating out of five. Now that the PowerMac line has had a premiere midi app, does the TOS platform matter considering the high price of the hardware.

$1800 Buys a fast Performa 6400/200 with 2.4 gigs, 256 k cache, 16 megs ram, keyboard, 28k modem, internal subwoofer, Surround sound(SRS) and software bundle.

You know what the Hades cost..

I've got to agree, my Atari virtually never crashes, it's a very solid
machine. I've also had it for 8 years, it's on for quite few hours
virtually every day, I crash about once a month and thats normlly when
I set up too many sessions on my internet software. In all this time
the only thing that has ever physically gone wrong with it is when the
PSU dies but that's hardly a failiure of the machine itself.

435. GEMulator FAQ in the makig

Newsgroup: comp.sys.atari.advocacy
Date: 1997-01-29 00:00:00 UTC
From: cronos@worldaccess.nl
Message-ID: <N.012997.111651.08@wxs4-8.worldaccess.nl>
Source record: 6680

Hi there, and sorry for the cross-posting...

GEMulator is an Atari ST emulator for PCs. The creation of a newsgroup is in the making, although limited to a planning stage at the moment. I am currently setting up a FAQ file, and I would like to request everyone who has fixed any of the problems he ran into to write them down (including their solutions) and mail me at my private email address. It looks like the first version of the FAQ will primarily be questions (so you're welcome to ask questions that you don't know the answers to, too), but I'm sure we'll get there in the end.
If you want to be put on the GEMulator FAQ mailing list, please email me with a subject of "sub GEMulator FAQ list".

If you want to have a look at some of the problems *I* am having with the GEMulator...

1) "ST Zip" won't work. It cannot write (deflate) anything; it gets write errors on the hard disk. Can this be fixed?

2) Can "FastCopy Pro" be made to work? I tried to copy a disk (this had readable directories and folders) and, although FCopy appeared to work fine (albeit slow when writing) the target disk had 0 bytes used, and no folders either.

3) "Revenge Doc Displayer" refuses to be installed properly. How come?

4) "Freedom" seems not to work; the file selector seems unable to let you save a document that already exists, although it does update the time stamp.

5) "Xboot" sees folders double and can't find its own "c:\XBOOT\" path. Suggestions?

6) "Ledpanel" doesn't work.

7) I tried installing Geneva and Neodesk 4 on the GEMulator. Neo4 seems to work just fine. Installing Geneva goes fairly OK, but it can't use Neo4 at the same time. I think the problem is the following: To autoboot Neo4 from Geneva (as a shell), Geneva has to read the specs from GEM.CNF. And the GEM.CNF is always 0 bytes after installing it on GEMulator...

8) The GfA Basic compiler "MENU.PRG" screws up compiling. I fixed this problem...a solution will be in the FAQ.

9) A failsafe way to check the write-protect status (on any Atari, any TOS version) won't work on GEMulator. How can one check this now?

That's it...I hope there'll be lots of response.

: the hardware.

Did the TOS Platform ever matter?
To me it did/does...because I own some...paid my good money several years
ago and the freak'in thing still works...so it matters! Now...there's
no contest when it comes to which machine is the best...you're wasteing
your breath here comparing a 1992 release machine with a 1997 release...
the Mac is the way to go if you are "just now" selecting a new computer
and have 0 to few investments in software, data files, etc. Use your
brain man! Most professional minded people buy a tool, and they wear it
out...and get as much life from it as possible...hence they can make more
of their capital rather than constantly replaceing perfectly good tools.
Eventualy, TOS owners might be foreced to move on...but till then...why
throw away a couple grand (minium...not counting software replacements)
when you don't really need to?

Are you saying that everyone who owns TOS based machine should get rid of
it and by a Power Mac simply because it's newer? That's damn crazy! With
that attitude...you'll never get ahead because you'll be spending all your
profits on new computers and software every year...at least there are some
people out there who understand that supporting something that people use
every day matters. Now wouldn't you be pissed off if you went to get
a part for your car, and no one "supported" your make of car anymore
because it's over 5 years old? You paid your good money for it...and
it matters!

TOS does matter as long as there are people using the machines.

: $1800 Buys a fast Performa 6400/200 with 2.4 gigs, 256 k cache, 16 megs ram,
: keyboard, 28k modem, internal subwoofer, Surround sound(SRS) and software
: bundle.
:
: You know what the Hades cost..
:
Hey...what does the Hades have to do with VST?
The Hades does not support sound as it is...I don't think CuBase Audio
will even run on Hades. New C-Lab Falcons are around $1,100 with 14 meg
of RAM. Granted...I'd most likely choose the Mac if I were shopping today

for a new Computer for Audio and could afford to shell out 1,800...but I did my shopping a few months ago, and my Falcon 030 with 14meg of RAM and CuBase Audio only set me back $700...that's a long way from $1,800! I turned around and sold my STe and a bunch of other junk for a little over $200.00...hence...$500.00 got me into digital recording. It's not that I want to be a cheap-scape...I simply don't have much choice.

The Hades isn't even designed to compete with the Power Mac...
It is simply a custom made niche machine for people who want
or need something "different". No one is going to make tons of money
selling Hades...but then again...not many people make tons of money
playing golf either...but they do...so it MATTERS!

Brian

I had WIN-OS2 installed for awhile and it worked with most software
that wasn't tied to deep into the hardware. I finally decided that
WIN-OS2 was just taking up space and took it off. I still have
Windows 3.1 on a separate partition if I need it.

I found that OS/2 and linux do most of the things I'm really
interested in so Windows is just a backup or in case I need to
use Word or something.

: |
: |What would it take to interface win-32 to PM???
:
: Stupidity.

WIN-OS2 is a viable option for those that need MP in Windows 3.1.
I had a Watcom Windows compiler and if I wrote something that
crashed Windows, I just had OS/2 kill Windows (what a feeling) and
started over.

The problem is is that most ISVs that write Windows software see
WIN-OS2 as a different OS and don't test or support it. You
kind of take your chance. You still almost need regular Windows
as a backup.

I could see situations where you could be working for a company
that uses WIN-OS2 and they have a limited set of applications
that all work fine and you use only them.

If you really want win32 then get NT or 95. Your kidding
yourself that you want OS/2.

Then use news agents that aren't quite so primitive.
You have the capacity to filter out whatever you don't want
or don't want to pay for it. Use this capacity and stop whining.

This whole sub-thread is a big fat Orwellian red herring.
They merely re-defined QuickTime such that the video driver
layer became a part of it. The 'multimedia engine' is still
just another api.

Yes, QuickTime is just another API. Like the File Manager and Quickdraw.

80+ pics of Paulina Poriskova, sexy supermodel!
70+ pics of Bridget Hall, supermodel!
50+ pics of TRACI LORDS, yes! ***6 Celeb CDs in One!***
50+ pics of Daisy Fuentes, hot spanish VJ
50+ pics of Salma Hayek, sexy latina actress! order now
50+ pics of Teri Hatcher 1-757-686-1271
* 4000+ pics of other NUDE stars
* 4000+ pics of PG-13 rated celebrity poses
* 10,000+ pictures total, thats TEN thousand!
* Graphics viewing software for Windows3.1/DOS/Win95
* CD is BBS ready, with descriptions of files! And its Mac readable!
* Many more features and pictures of stars!
* NO AMATURE MODELS! - ONLY Celebs!

(Orders call 757-686-1271)

Other information:
* Packed in white shipper: No signs of nudity (Wife protection plan!)
* There are over 10,000, that's TEN THOUSAND FILES, on ME#3 alone!
* All pictures are high quality at least 640x480!
* Directories are arranged in NUDE/NON NUDE format for easy use!
* Graphics viewing software for Windows/DOS/Win95
* CD Is ISO-9660 Macintosh compatible if you have a Mac JPG viewer

* It's truly BBS-ready with detailed descriptions of all files!
* ME#3 will save you -ALOT- of download/searching TIME & MONEY!
* Sysops! Has a files.bbs conversion program for different formats!
* Many more features.. Guaranteed or your money back!

This CD represents high quality work. Here is the pricing:
$$$ $36 each (plus $2 shipping, $5 shipping outside USA) $$$

(*) Call 757-686-1271 to order via credit card over the phone!

Qualifications: You must be OVER 18 & live somewhere on planet EARTH!
Please remember, Foreign orders add $5 for shipping instead of $2

ME#3 ..'~ Midnight Escape ~'..

The UK is one of the many countries where local calls are not free.
(In general. Some cable companies give free local calls, but they
exclude calls to ISPs).

He's using Demon. They do have local call access nationwide, but
these do carry a smallish charge. Demon itself is 10GBP (USD16)
per month.

My ISP also charges online time (between 1p and 1.5p per minute), in
addition to the local call charge. Believe it or not, there are reasons
why this is a Good Thing.

Actually, the file manager is an application and QuickDraw is
a virtual device interface. QuickDraw is what's banging the
hardware, NOT QuickTime.

Jus like VfW->MyCard.drv
or OpenGL->MyCard.drv
or DirectX->MyCard.drv

Actually, QuickTime (at least on the Mac) does "bang" the hardware. The lowest level of QuickTime, QuickTime components, interfaces directly with the drivers for your multimedia hardware. It is the only part of the system that attempts to control your MIDI and video capture hardware. It shares control of video and sound resources with QuickDraw (actually, the Graphics Device Manager which is a layer below Quickdraw) and the Sound Manager. I also question whether the File Manager is really an application. It does not get schedualed like an application and it shares memory with the operating system. In most microkernal designs, however, the file manager is usually implemented an a server application.

No monitor, right?

Once again, you're clueless, at least as far as what musicians are looking
for in a system. A Falcon (NOT a hades) gets you near the 6400
in performance (number of audio tracks, real time effects, etc, although
the Falcon's are not as cool) with the same number of audio inputs and
outputs (2 ea, although the Falcon's are slighter better quality).

The Falcon also offers lower priced expansion boxes (Digital interface for
under $300, Mac's over $500; 8 input/8 output boxes, around $1k on the
Falcon for both, at least $2k on the Mac; ADAT interface is cheaper, not
even available yet on the Mac without a Digidesign system, at least $2k;
etc). The Falcon also offers demonstratably better MIDI timing which
is why many musicians are still using Ataris (built-in MIDI), and the
Falcon features a Motorola DSP chip built in.. again, if you want
DSP chips on the Mac, buy a DIGIDESIGN board..

Now, where the Performa might shine is in real time effects (still yet
to have all the problems ironed out like delay, etc, but a great idea)
and a prettier user interface (color, etc.). The Performa also has a
wider variety of applications written for it, and is faster overall
(the processor speed makes up somewhat for the lack of DSP).

I will say I've had far more crashes on my Pro Tools III system
at work then on my Falcon at home..

Price? If you could find one used, you're probably looking at $1200
or so for the Performa (with monitor) where a Falcon used is more like
$500 (complete).

> You know what the Hades cost..

Just to clue you in again, musicians in general aren't all that
interested in the Hades because it doesn't have an onboard DSP

chip so Falcon specific apps won't run (like Cubase Audio).

So, to conclude, you don't know what musicians are looking for in an app. Cubase Audio VST/Mac is very promising, but until someone releases affordable expansion options for multiple inputs and outputs, ADAT, etc (Yes, Korg has announced a PCI card that would work at $1200, but they still haven't shipped a single one), the Falcon remains a very viable and more affordable option for MIDI and digital audio production. Look in the January '97 issue of Sound on Sound where the Falcon's capabilities are discussed in conjunction with a review of Korg's new digital mixing board.

-Mark

455. Where in the world is the Falcon030?

Newsgroup: comp.sys.atari.advocacy
Date: 1997-02-01 00:00:00 UTC
From: aaronc@pacifier.com
Message-ID: <aaronc.854821450@pacifier.com>
Source record: 6600

Several years ago, when the Falcon was first introduced. I read about it in some computer mag. I was really interested in getting one! But never once did I see one or hear of a store that sold them. I guess they were mostly sold in Europe from what I hear. But it seems like there must be someplace in the US where I could get one. I'm still really interested in getting one...so does anyone have any ideas of places that sell them? Web sites or something?

Thanks!

-Aaron

And you have benchmarked this? Whats your deffinition of near 6400 performance? Do you know what a 6400 is?

The Falcons are stuck with antiquated 030 processor that needs a DSP.. All this audio inputs and outputs can be added to the 6400 and still be cheaper..

> The Falcon also offers lower priced expansion boxes (Digital interface

> DSP chips on the Mac, buy a DIGIDESIGN board..

Source please.. The reason the 6400 does not have a dsp is due to the risc PowerPC.

And you have evidense that the Falcon has better timing? What if the musician wants to do other tasks besides midi like web page creation, and having the best internt tools?

>
> Now, where the Performa might shine is in real time effects (still yet

Thats the deal with PowerPC..Why saddle it with DSP hardware when the hardware changes constantly. By April, 300mhz will be mainstream..

>
> I will say I've had far more crashes on my Pro Tools III system

PowerTools III system? Must be a Mac clone firm. I would check with your extensions to make sure none are conflicting. That should solve your crashing issue..

>
> Price? If you could find one used, you're probably looking at $1200

Now were talking about used.. So what happens when you need work? Toad is not exactly cheap..

Heck I can get new refurbished PowerMac Performas 6116 for $599 with a 90 day Apple warranty. Price includes keyboard and CDROM(option and extra cost for Falcon).

>> You know what the Hades cost..

The Midi market has standarized on Mac/PC. I hardly see any mention of the Falcon as a midi station.

I bet that Cubase Audio VST/Mac system out sells a Cubase Falcon one. So your asertion is that Falcon will remain viable due to cheaper expansion options? Do you have proof?

Ignorance? I pay at least $12 a month flat rate for unlimited local calls. As Usual, you Brits are use to pay alot in your society. Like high taxes for substandard schools and health care.

I shouldn't complain because if I walk off the plane at Heathrow and break my leg I am covered at your gov't expense due to my dual U.S./UK citizenship..

Thankyou..

>
>And you have benchmarked this? Whats your deffinition of near 6400
>performance? Do you know what a 6400 is?

It's a performa with a 603e, at 180/200 mhz in a mini tower and all
the usual Mac stuff. You know what a Falcon is?

>The Falcons are stuck with antiquated 030 processor that needs a DSP.

Imagine that! Using a digital signal processor to process digital
signals instead of a general purpouse chip, poor Falcon owners!

>All
>this audio inputs and outputs can be added to the 6400 and still be cheaper..

Go on then, cost it all up at general street prices and we'll se who
comes out on top.

>> The Falcon also offers lower priced expansion boxes (Digital interface
>> for
>> under $300, Mac's over $500; 8 input/8 output boxes, around $1k on the
>> Falcon for both, at least $2k on the Mac; ADAT interface is cheaper, not

>Thats the deal with PowerPC..Why saddle it with DSP hardware when the hardware
>changes constantly. By April, 300mhz will be mainstream..

I really don't think you know what a DSP is, it's a custom chip
designed to handle digital conversion, a general purpouse chip is not
better than a dedicated chip, understand it for once.

>> I will say I've had far more crashes on my Pro Tools III system

I to spent over two years defending Atari and that low life Jack Tramiel. As all the mags started to disappear - and all the stores stopped supporting the ST - and all the software started to disappear - and all (or what there was of it) support from Atari disappeared, I faced the reality. THERE IS NO MORE ATARI. Please believe me, I was one of the strong Atari defenders out there - arguing day & night for therm.

But they never argued for me.... so.... a Mac or Windows? Doesn't really matter what I'm now using, but I'll tell ya something..... I'm happier.....

So long Jack.... you piece of garbage..... you stiff..... you creep..... you third rate hacker..... you.... you..... you.....

ahhhhhhh..... that felt good..... Now..... back to work on my system that has what I need.... and more.....

I think that you would find it difficult to find operations that the DSP
chip found in the Falcon can perform faster than a PowerPC processor.

There is more to the Falcons audio matrix architecture than
what you imply, and I think you know that. Digital recording
is built into the Falcon. That is why it performs as well or
better than PPC's directed towards the same market for a lot
less cash. In the end, the PPC will cost more to outfit with
no obvious advantage over a Falcon for the purpose of digital
recording except that Cubase Audio is in color:). It's also a
much more compact machine. My C-Lab case is 2.5"x11.5"x17.5"
and aside from the standard Falcon interfaces, houses a 1.03gb
2.5" IDE drive, a 3.5" 1.6gb SCSI drive and an IDE EZ135.
The machine has over 46mb of RAM and is quite responsive.
Pretty easy to carry over to the local noise shop. Add a
Bit-Bopper setup and it's ready for nightclubs (Monitor
not necessarly needed).

That wasn't the point, a DSP will out perform a PPC chip Mhz for Mhz,
Pete howver seems to think that dedicated chips are a bad idea.

Cross-posted to: demon.ip.support.atari,comp.sys.atari.st,comp.sys.atari.advocacy

With the recent unfortunate news about Daron Brewood being linked with
a porno racket on the Net, I have a few questions to ask concerning
how the law stands. Is it illegal to download porn, keep it on your
system, or upload it(from an external source) to say, your web page?
I've only a few times come across pics I'd rather wouldn't have, and
have deleted them from my system straight away. IMHO they weren't any
worst than pics you would find in a mag, on the top shelf. Are there
any other points to be aware of regarding this matter...? It was also
said that Demon had been monitoring him for 2 years, are ISPs allowed
to do this?

Thanks,

James

Hmm, our NHS is better than the US health care system, the prime
concern of the paramedic, when attending to a US heart attact patient,
is to check his wallet for a credit card, if none is found, he is then
left for dead, if that doesn't suck, tell me, what does...? Our
schools aren't substandard either, that is another American myth, I
suppose you belive we have a 'fairy tale' money grabbing royal family
as well!!? Get a life...! :*|

This is kind of off the subject, but health care in the U.S. is both
expensive and limited unless you are very wealthy or have very good
employee benifits. Of course the State picks up the tab for welfare
people like Sinplop. As far as money grabbing politications, the
assholes
that represent the U.S. government, or more specifically, the special
interest groups rob working people of their earnings to support insane
projects that generally do not benifit the tax payer but the special
interest
group(s). The U.S is in need of a major overhaul and Clinton is not the
answer.
The major problem, IMHO, is the incredibly amout of people that come
to the
U.S. each year on government programs, causing way to much
overpopulation.
Clintons inability to cease gang activity or drug traffic. The crime is
so
bad in citys like Los Angles that movies like Escape from LA are a

Disney
story in compairson. Massive contrabutions to hostile forign nations
continues
only to have them turn face the following year. The New World
Order is a bunch of shit and is doing nothing but to cause substandard
living
conditions in the U.S.

First and best example is the Desert Protection Act in California.
Sierra Club "Hike to Hell", the Phantom Duck.

[Newsgroups: reset to include c.s.a.a for the benefit of all those
mystified by things in the original, followups set to alt.dev.null where
they belong]

In article <5cdt3e$dmq@ornews.intel.com>, Rich Tietjens wrote:
: Your spamming costs me money. Notice my email address on this post; I pay
: for my Internet access, and for my entire domain's access. Therefore, your
: spamming IS my business.

This assumes that Peter is spamming.

You see, while definitions of spamming vary, I don't think that any
reasonable definition includes two _crossposted_ groups as "spamming". I
can see two multiposted groups being construed as spamming, but
crossposting takes nearly no additional bandwidth. The gain is so small
that you could save more by eliminating the single sentence I wrote above.

Crossposting is simply addition of a single newsgroup to the header. It
costs nearly no bandwidth. Multiposting is something else entirely: the
posting of an identical or near-identical message multiple times. It
sucks tremendous amounts of bandwidth. Peter's posts are crossposted,
and, unless I'm mistaken, he hasn't multiposted at all (If he has, I'd
like to be able to verify that).

And if you really want to save bandwidth, go to
http://www.rahul.net/dhesi/nojunk.txt and start dropping packets coming
from the major spam sites listed there. It's far more effective than
complaining about a few extra bytes in the header.

: Your sysadmin has basically said he doesn't give a shit - but if this
: continues, I'll ask Chris Lewis to get involved, and then your
: sysadmin WILL learn to give a shit, becasue Chris Lewis is capable of
: convincing all other admins (or a significant percentage of them) to UDP
: the uni.edu domain for spamming.

Who says he will? Chris Lewis (for those who don't know, he's one of
the most prolific spam cancellers and an active participant in
news.admin.net-abuse.*) does not, AFAICT, use the UDP lightly, and this is
a very light case indeed. It takes a very loose definition of spam (IMO)
to interpret Peter's actions as spamming (Out of curiosity, what is your
definition of spam? I use a Briedbart Index of >20; it would take a 400
group crosspost to do that). Now if you want, you can drop packets that
come from uni.edu, that are intended for uni.edu, or that mention uni.edu.
It's probably not a good idea, but you won't ever see Peter again.

: That would be greatly inconvenient to the University adminstration and
: students. Eventually, the source would be traced to you and your
: buddy in whatever uni.edu calls the information technology department.

Again, _IF_ this happens. And I'm quite sure it won't. Chris Lewis is
a reasonable and intelligent person. You have apparently become so angry
at Peter due to his idiotic fanaticism that you are willing to take
extreme measures to make sure that no one ever hears from him again.
While I'm not saying that it's good that he's still here, I do think that
you've gone quite a bit overboard in this case, and I would suggest that
next time you see a post of his, you stop, get up, walk around, wait
until you calm down, come back to the computer, and quietly go on.

A 56001 DSP probably does not outperform a 603e in any sense.

Dedicated processors aren't bad. However, whether they are appropriate
depends on many different variables.

Right now, DSPs for audio processing are sort of useless, because you can
get sufficient FP performance from modern CPUs that you don't need a DSP.
In the Falcon, a DSP is required, because if you didn't have one real-time
effects would be impossible.

On the other hand, dedicated hardware for 3D rendering is currently a hot
item. Sooner or later, the main CPU may get fast enough that we can lose
the hardware, but right now you cannot get excellent 3D performance
without some form of acceleration.

>Pete howver seems to think that dedicated chips are a bad idea.

I think that dedicated chips are only a good idea if the main CPU cannot reasonably handle the load and the user wants that functionality. If you buy a modern general purpose chip then you don't need a DSP and a general microprocessor is more versatile. As another post mentioned, however, 3D rendering cannot be reasonably handled by a general micropressor and a lot of users want fast 3D rendering.

The civill libertarian in me gets quite annoyed at all the hue & cry.
Here in Canada a fellow was busted for possession of porn (apparently he
was into 13 year old males) when the cops raided his hard drive and
found the images he downloaded. He was using a text-based LYNX/PINE/TIN
server via a freeNet. He would therefore have had to downlosd the files
and view them off-line.

Had he been surfing with a pentium or whatever, presumably he might have
been able to indulge in his kink by just browsing the images online. The
legal complications occur when you download the images and save them.

476. Apple to lay-off one quater of work force

Last night on the CBS news it was reported that
Apple will lay-off as much as one-quater of
it's work force as soon as tomorrow.
Not that I hate Mac's, but my crystal ball
seems to see more than SinClaps wet dreams.

Now what would be nice, in this newsgroup at
least, if most were design people. The could
take a walk down to JTS, offer to work at a
slightly reduced wage, and go to work with
the basement remains of the Falcon. Perhaps
intergrating the RISC processor onto a TOS
motherboard:). (Just a joke, they will
probably make more on unemployment).

In all seriousness, it will be a sad day when
all you can purchase boot's up to say
Microsloth on the screen:(.

Go Hades, Go Afterburner, Go Mac Clones.

Do yourself a favor, tell a friend about
YOUR machine and software and keep them
out of the PC shops. A loosing battle,
I know, but at least i'll die knowing
i've saved a few:)

Let's Kick Intels Ass :)

I wasn't surprised. Apple's workforce has burgeoned over the past three years. They're returning to $8 billion days' employment.

> Now what would be nice, in this newsgroup at
> least, if most were design people.

I would guess that most are Newton people. Remember, Apple's PowerMac and PowerBook lines are profitable. The Performa is usually profitable as well (this Christmas being the exception, a BIG one). Monitors/printers and other peripherals are also money-makers. What Apple is likely doing is shutting down much of the unfocused and unprofitable R&D. They are likely selling Newton entirely. Remember, if Apple had no R&D budget, they would have made money last year. I suspect that Apple knows this, is ending its "be-all" status, and retreating to developments close to its product line.

The could

JTS is in huge financial trouble already. The cash infusion from Atari saved the firm from death, but they got all that wonderful debt along with the carcass of Atari. If I had $2 million, I would buy TOS and the Falcon, start up my own company (Falcon Technologies?), and license a PowerPC version of TOS to the masses. Get a viable clone base going.

PowerTOS wouldn't be hard to make - just take the phase 5 approach by including an 030 along with the PPC chip for backward compatibility, add some kickin' APIs for video and audio. TOS already has the preemptive multitasking and multithreading needed, as well as memory protection.

> In all seriousness, it will be a sad day when
> all you can purchase boot's up to say
> Microsloth on the screen:(.

I wouldn't despair. At the very worst, Apple will simply retreat to its core markets and live there. It works for Sun. And C-LAB will keep making Falcons.

> Go Hades, Go Afterburner, Go Mac Clones.

Mac clones are doing quite well. Something that may interest you - overall Macintosh market share (including clones) didn't change last year. The media is slamming Apple's drop in sales, but that drop came about primarily because Power Computing and UMAX were undercutting Apple's prices in the low end. I am not predicting the end of the world.

> Do yourself a favor, tell a friend about
> YOUR machine and software and keep them

Every time I tell them about Falcon or Mac, someone like JEDI comes in and dictates how superior and seamless life with 70's-era hardware and software is. And they go for Windows 95. We users have to learn that a frontal assault isn't the way to go. We need to build up supremacy in a number of niches, grow our companies to large size, and then declare war. Again, look at Sun Microsystems. Not hurting at all, but hardly an ubiquitous model of machine.

> Let's Kick Intels Ass :)
>
> Mike

I wish. . . I suspect Intel is even tiring of Microsoft. Fear not, a sea change is in the air. Other hardware makers besides Apple are hurting. Their anger with MS licensing, etc. will seal MS's fate. But it will take some time.

> performance? Do you know what a 6400 is?

Don't be such an idiot. I work on Macs daily, including said 6400.

On the other hand, just how much experience do you have with the
Falcon? Have you ever edited digital audio on one?

Also, I'm talking about OVERALL audio performance, not just processor
speed.

> The Falcons are stuck with antiquated 030 processor that needs a DSP.. All
> this audio inputs and outputs can be added to the 6400 and still be cheaper..

See, you have NO CLUE what the FUCK you are talking about. I am a
Professional audio editor and musician with over a decade of experience
in digital audio. You know nothing about the subject. Pro Tools
Project is the least expensive currently available Mac system that
offers 8 outputs and 8 inputs. It is around $3k, NOT including the
computer. The Korg card, which offers only 2 inputs and 2 outputs (but
is expandeable to 8 inputs and 8 outputs for another $1500) is $1200
itself. That's all there is out there, moron. I will assume you have
spend a little time in math class, so I'll let you do the math yourself.

> Source please.. The reason the 6400 does not have a dsp is due to the risc
> PowerPC.

Which I alluded to, but you cannot use effects that were written for a
DSP chip (like all DIGIDESIGN effects) on the PPC without a Digidesign
card. Yes, some are being re-written, but they haven't been yet.

> And you have evidense that the Falcon has better timing? What if the musician
> wants to do other tasks besides midi like web page creation, and having the best
> internt tools?

Yes, I do. There have been a couple of articles written in european
music magazines that deal with this question. Try searching the

archives of Sound On Sound if you really want to know.. and I trust you
don't.

Also, because of the way the Mac handles digital audio via its inputs,
there is a slight audio delay when recording new audio while listening
to previously recorded audio, especially when VST's real time effects
are used. It's not a huge delay, but it's something to be aware about..
if you're recording timing critical audio, it might interfere with your
groove.

Nice try attempting to change the subject. The issue is AUDIO tools,
not WEB tools or word processing.

> > I will say I've had far more crashes on my Pro Tools III system
> > at work then on my Falcon at home..
>
> PowerTools III system? Must be a Mac clone firm. I would check with your
> extensions to make sure none are conflicting. That should solve your crashing
> issue..

Now, you've demonstrated your complete IGNORANCE of the audio world.
Pro Tools III is a Mac based digital editing system.. THE MOST COMMON
ONE IN THE WORLD. If you don't know what THAT is, then just shut up
about audio on the Mac. You're clearly talking out of your ass.

> Heck I can get new refurbished PowerMac Performas 6116 for $599 with a 90 day
> Apple warranty. Price includes keyboard and CDROM(option and extra cost for
> Falcon).

Sure.. you could. But the same audio input/output issues apply. If
you're buying it for audio, who gives a damn about CD-ROM?

> The Midi market has standarized on Mac/PC. I hardly see any mention of the
> Falcon as a midi station.

And you've already demonstrated your ignorance of the market by not even
knowing what a Pro Tools system is. Truthfully though, the Falcon is
not very popular compared to Mac/PC. But I'm not buying a computer
based on a popularity contest, it's how well the computer does what I
want it to do. It does, for less money.

> I bet that Cubase Audio VST/Mac system out sells a Cubase Falcon one. So your
> asertion is that Falcon will remain viable due to cheaper expansion options?
> Do you have proof?

Yes, Cubase Audio VST clearly outsells a Cubase Falcon.. it seems like a
system with excellent potential. I'm making music NOW, not waiting for
potential.

It eventually will be a better bargain then a Falcon. I don't know
whether the Falcon remains viable or not.. I just know it IS now, I can
create without limits right now. That's all I need to know.

I already gave you proof, I gave you model numbers and prices. You gave me a bunch of hot air and demonstrations of your ignorance.

You already have a Mac, you know little about the Falcon, and even LESS about digital audio production. Tell you what.. I won't speak out as an expert the Mac computer if you won't speak out on ANYTHING that has ANYTHING to do with digital audio production ON ANY FUCKING PLATFORM.

Laws regarding depictions of the naked human form vary from place to place,
James. In parts of the US, it's illegal to sell Playboy. In other parts,
it's illegal NOT to sell it (censorship being cited). I suppose the UK has
its own share of wierd laws regarding sex and images of it.

>I've only a few times come across pics I'd rather wouldn't have, and

In the US, they are allowed to do it BUT if they reveal any information so
garnered to a third party (including law enforcement officials) without a
court order, they are violating a great number of laws. Again, the UK has
its own strange rules. I don't know what they are, but odds are good that
they are unique to your island nation.

Well said, Tony. It's wise to remember that the person in question is
innocent until proven otherwise in a Court of Law.

AFAIK, it's illegal under the Obscene Publications Act in the UK to have any pornographic material in your possession, no matter how it's stored. The illegality obviously doesn't include topless or nude photos, and begins with anything depicting the sexual act.

> have deleted them from my system straight away. IMHO they weren't any

If you're talking about the sort of nudes you see in mags like Playboy or lower-end junk like Razzle, then you should be OK.

I'd take that with a pinch of salt. Demon have always made a stand against Internet censorship, and I doubt they would do so without a High Court order. I also can't believe that the UK Police would monitor an individual's internet access for such a long period of time, either.

Why? A PowerPC is fast enough to emulate the 030 much faster than a real 030. Even with Apple's original 68K emulator on the 6100/60 (60 MHz, no L2 cache), users saw emulation speed that was faster than a Mac IIfx (40 MHz 030). With a dynamic recompilation emulator, I have observed emulation speed twice as fast as a 40 MHz 040 on a 100 MHz 601. Adding a second CPU that uses a different memory bus protocol adds a lot of complexity (and therefore cost) to the machine.

Fast emulators eat lots of memory (Apple's original emulator has a 512K dispatch table in ROM, and DR emulators use several hundred KB for translated code caches), but these days memory is cheap.

> add
>some kickin' APIs for video and audio. TOS already has the preemptive

Atari enthusiasts interested in a lightweight OS that supports all sorts of neat stuff without incurring overhead should really look at BeOS. It's much better than TOS, easier to write programs for, etc. Be is no longer going to produce the BeBox; instead they are going to target PPCP and Macs. But you can get nice Power Computing machines for cheap, and PowerComputing is going to start bundling BeOS as well as MacOS with their machines.

Somebody should write an Atari ST emulator for BeOS. (Actually, I'd like to see one on MacOS too. MagiCMac is nice, but it really isn't that compatible.)

If Apple and Be hold to their current promises for OS development, within a year I will finally have a system I'm really happy with: a fast non-Intel processor with a real OS, and a second OS to hack with.

Rich, where in the U.S is it that I can not purchase
Playboy? I sure as hell don't want to move there:).
This censorship thing is getting to be a big problem
in the U.S, and i'm not just talking about Playboy
stuff. On the news last night, the lady incharge of
the French language usage in France, implied that
the University of Georgia because of their 80% English
pages would be banned from the French domains. Hey,
it dosen't bother me one way or the other about the
language thing, if it's TOS i'll figure it out:).
How did Clinton get elected again? What the hell
is wrong with the American Public? Was it the
illegal aliens that voted for him after he granted
them amnisty with my tax dollar? You know I can get
pretty wound up when someone says something bad about
a Falcon, but when someone starts sticking up for
the political officals that are running the U.S into
the ground and distroying all the natural resources
I really get pissed. I know this dosen't belong here
but I wasn't the one who started the UK-US healthcare
shit in the NG. I better stop before I go call some
800 government numbers to relive my inner fustrations.

Remember, one if by land, two if by sea. This definetely
looks like it's comming by land.

>A 56001 DSP probably does not outperform a 603e in any sense.

I must confess I don't have any hard fast facts about this but the DSP
doesn't run particularly fast. How fast would a 603e need to be to do
CD Quality audio?

>Dedicated processors aren't bad. However, whether they are appropriate
>depends on many different variables.

>Right now, DSPs for audio processing are sort of useless, because you can
>get sufficient FP performance from modern CPUs that you don't need a DSP.
>In the Falcon, a DSP is required, because if you didn't have one real-time
>effects would be impossible.

Not impossible but of a much lower quality, my Atari ST with nothing
but a 68000 cpu does realtime effects on 8-bit audio at upto 30khz.
CD quality is about 3x the data.

>On the other hand, dedicated hardware for 3D rendering is currently a hot
>item. Sooner or later, the main CPU may get fast enough that we can lose
>the hardware, but right now you cannot get excellent 3D performance
>without some form of acceleration.

Ok then fair enough, maybe for simply sampling audio it's not much use
but as far as things like games are concerned, using the DSP to do
visual and audio effects leaves a lot left for the main CPU and a

similar thing with multitasking.

And just a final note, i'd like to re0iterate what I said when I first began posting here (as I guess many here have joined since). I quite like macs, they're pleasnat machines and they can do some things that Ataris can't. But Atari made some superb machines which are under-rated and highly capable with a bit of fine-tuning. I'm more an arguer against the crap arguments Peter puts straight forward than the Mac itself. So there you have it :)

>Does anyone know if you can use the HP LaserJet 5L with the Atari TOS
>and the new Atari compatible
>Thanks,
>Chris Heiden
>.
Chris,

The 5L works brilliantly with the atari computers. Use the HP L4
driver in NVDI4 gives you 600 or 300 dpi printouts On the TT with
outburst prints a page in 20 seconds In magic use the new print prg in
the auto app folder and printing is even faster than outburst.

You will have to edit the print driver to remove the page commands in
the L4 driver using the print driver edit program that comes with NVDI
this will fix the auto page feed problem with the 600 dpi driver.

BZZZZT! Wrong. For one thing, Motorola has no reason to "offer or support" NT on Intel - as it sells no Intel systems. As for IBM, they have dropped NT, period. So have Gateway, Dell, and Compaq. Why?

Microsoft was forcing the VENDORS to support their buggy junk. If you sold computers, would YOU want to have to spend money to keep it running junk MS OS's?

NT is now ONLY supported by Microsoft. It burnt all of the hardware makers, and with good reason, too. NT4 has been nothing but a disaster for a majority of enterprise sites, especially those that upgraded from 3.51. I have seen several clients have it crash and burn (4.0, that is). I count my blessings every day that I exited the hardware support business.

CHRP's promise was any OS on one machine, now it is just
> MacOS and BeOS...

Not true, technically. It also includes Linux and Rhapsody (Mac OS 8). Incidentally, Mac OS 8 will run on Intel machines as well, as announced by Gil Amelio at the Apple Shareholder meeting today. It should make it very easy to move to PowerPC when Intel hardware reaches the CISC limit. CW already says that the Pentium Pro will max out at 225 MHz, and any RISC chip Intel comes out with will be expensive and difficult to switch to.

>
> The NeXT merger was greeted with mixed review as well. One of the
> largest stumbling blocks ahead is that Apple has no definate plans
> for their next OS and developers are dropping out of the Mac platform
> daily.

This is also inaccurate. Apple has a very concrete plan for their OS (visit their Web page)! Basically, Mac OS 8 will be UNIX, the Mach Kernel, running with a hybrid Mac/Next UI. It will be backward-compatible with Mac SYstem 7 applications. It will run on CHRP and Intel. Since CHRP is higher performance, it will make it easy to move to CHRP from Windows NT.

Net developers in the Mac development team are growing. Developers are dropping out of Windows in droves as well. Why? They're going

bankrupt. There are no "mass dropouts" of any major developers (or minor ones, for that matter).

>
> All of this news can be found in Reseller News. the pulse of the
> Computing market and Industry.

Not hardly. CRN is a rag primarily aimed toward Intel clone builders. It is hardly an unbiased source, and regularly prints factual errors. They would also be less than friendly toward Atari, to say the least.

> All the best,
> Chris @ Computer Direct

I would suggest it is better to support CHRP than to move away from it. 544 MHz PowerPC chips are going into new Macs this year. The PowerPC is preparing to go from 20% outperformance of Pentium systems to 300 - 400 percent outperformance. And Mac OS 8 is the OS that will be most familiar and comforting to Atari customers moving to newer equipment.

Any future TOS systems will also revolve around CHRP technology, not Intel.

Last week IBM and Motorolla announced that they were dropping WinNT development and support for PPC but will continue to offer and support it on Intel. CHRP's promise was any OS on one machine, now it is just MacOS and BeOS...

The NeXT merger was greeted with mixed review as well. One of the largest stumbling blocks ahead is that Apple has no definate plans for their next OS and developers are dropping out of the Mac platform daily.

All of this news can be found in Reseller News. the pulse of the Computing market and Industry.

All the best,
Chris @ Computer Direct

Why Windows 95 does not suck !!!

by SabreRider

Over the past year I have heard several people make the comment
that Windows 95 sucks, without even trying it. Well I'm here to tell
you, as an actual user, that it does not suck.
Proof of my statement can be found by simply looking at the
Windows 95 documentation! The capability to SUCK just isn't a natively
supported feature. However, for those people who insist that Windows 95
DOES SUCK, you need to do the following:

1. Increase your ram to 128 megs.
2. Free up 1 gigabyte of HD space.
3. Upgrade your motherboard to dual Pentium Pro 300s.
4. Increase your video ram to at least 8 megs of rambus.
5. Install the W95 dial up adapter kit from UND.

and finally,

6. Install the official Microsoft W95 "virtual sucking
device" driver.

Be sure to backup all of your Word documents as text files so you
can access them under the MS-DOS Editor program.

*Windows 95, Microsoft, MS-DOS, W95 are all probably registered
trademarks of Microsoft Corp.

** Pentium Pro is probably a registered trademark of Intel

Hey, just reporting what the "Industry" is reporting. If this news is as you say, BZZZZT Wrong, then perhaps if you care, you should grab a copy of Reseller News for yourself and follow up on it.

Regardless, the "Industry" "feels" Mac/Apple is dying a slow and painful death along with PPC. This is what they are reporting and as you know, if the media says something long enough, people believe it.

This of course is not how I "feel" about the situation, just how it is being perceived by "most" resellers in the industry, including Apple resellers.

Apple developers are not lining up to dev for the new OS'. Even Adobe has not made any solid committments past System 7. If they have, show me the press release.

All the best,
Chris @ Computer Direct

If Reseller News is reporting that Motorola is dropping PPC and going to Windows NT on Intel, it wouldn't surprise me. CRN is primarily an Intel-based rag and primarily caters to Uncle Joe's Computers and Toasters, Inc.

I am soon to be an Apple VAR, and have resold Apple products in the past, from Internet servers to small networks. I also sold many TOS systems for smaller businesses. I know the market, and know that demand in my neck of the woods for Apple technology (espcially Internet servers and related Internet technology) is wrong.

> Regardless, the "Industry" "feels" Mac/Apple is dying a slow and painful

That's right. The Wall Street Journal and various other "publications" are going gung-ho, writing articles that have no merit or basis in fact. I read an article in the WSJ yesterday that said "analysts believe Apple is fading fast." Of course, he only cited ONE analyst, who said "Apple still has some problems to overcome." Analyst (singular) is far different from analysts. It also said that Apple had not unveiled any new products in "several years" and that Mac clones were poor sellers.

The Wall Street Journal also said that Chrysler Corp. was doomed in 1991 to bankruptcy. Seems that today, Chrysler is dominating the auto industry.

Most of the Finance types writing this stuff don't bother to research the technical aspect of what they're doing, and focus on the Income Statement rather than the Balance Sheet. So they say Apple is dead (despite a net reduction in debt of $650 million and increase in cash reserves of $700 million last year) because of net income. And they recommend investing in a profitable Commodore International Ltd. in 1991, when the firm was choking under $200 million in debt, with only $65 million in cash, because it had a good profit year.

>
> This of course is not how I "feel" about the situation, just how it is

>

Again, you have no quantifiable evidence of this. If it is garnered from CRN, it is garnered from a publication that caters primarily to Intel/Windows resellers.

It's like me reading an article from the Bandito in Amazing Amiga mag about how horrible the Falcon is compared to the Amiga 1200, and saying that "major industry publications say the Falcon is weak for multimedia and really nothing special."

> Apple developers are not lining up to dev for the new OS'.

Wrong again. Take a browse through the Rhapsody web site to read all of the commentary.

Also, considering that Rhapsody ALPHA isn't even shipping yet, how can anyone commit to developing for it with absolute certainty? How many press releases lauded Win95 and committed to it? Not many, as there are fewer 95-only applications than Mac-only.

Even Adobe
> has not made any solid committments past System 7. If they have, show
> me the press release.

You're incorrect here, as well. Head over to the Rhapsody site and do some reading (if you're truly interested).

>
> All the best,
> Chris @ Computer Direct

Another interesting twist - Apple's customers are different from the PC clone makers, who sell to business in volume and video-game playing consumers in volume. In the media markets where Apple reigns supreme, it has strengthened its lead. Sales of high-end Macintoshes and PowerBooks are up too. The sales decline in units is entirely in low-end Performa systems. So in the markets that Apple markets too, resellers are overjoyed (other than the low-end ones).

> the Atari Police

Because Atari aimed for the wrong markets. It downplayed its video-game association, aiming for the business market (which didn't accept the pricey Mega and hated the ST keyboard, as well as Atari's name credibility), the publishing market (where it made huge inroads, but Atari quit after six months when it became obvious that to compete, development and promotion would be involved), the MIDI market (where the remaining STs in use are), and the "Atari Revolution" buyer (who bought whatever Atari put out, no questions asked.

Since Tramiel was simplistic in his business thinking, rather than develop and minimally market the ST/TOS series to compete in media markets and creative areas where Atari's name and technology were respected, they decided instead to milk the loyal userbase that they had inherited from Atari, Inc. and the early success of the ST based on

technology. When that shrinked to an unprofitable point, they dropped it (along with developers, retailers, and users), lying about intent to support and develop the machines to sell off remaining inventory. Then they simply went off to stun the world with technology yet again with the Jaguar. However, when Tramiel realized that a video game system would have to develop and minimally market the Jaguar to compete in media markets and creative areas where Atari's name was still respected, they decided instead to milk the ST userbase, who had bought orphaned Lynxes and Falcons made for a whole six months in North America. When it became clear that most users didn't want to be screwed a fourth or fifth time, Atari folded into JTS and screwed Jaguar developers, retailers, and users. (See a malicious pattern? It was also found at Commodore in Tramiel's days there, with the VIC 20, Plus-4, C16, and other "winners.")

What a history, what a waste. Atari, even up to 1993, had the chance to change the world. Instead, they blew it and took the easy way out. . . corporate death.

Oddly enough, John Warnock, Adobe's CEO, appears to feel exactly the
opposite way about Rhapsody (the new OS). Load up this URL:

<http://product.info.apple.com/pr/press.releases/1997/q2/970107.pr.rel.dev.html>

Quite easily, actually. Apple's announcements state that OpenStep will be
kept completely intact in Rhapsody. Their developer pages indicate that a
valid early development strategy is to buy a copy of OpenStep for the PC
and write an application for it.

Adobe has some nice looking products, but.....
i'm one of those spoilt little bast*ds whose
employer pays for his Mac software. I just got
Adobe Primeier 4.2.x and am not all that impressed.
I'm glad it wasn't my money. Photoshop is a pig, but
does do a nice job. i think it looses a little in
the translation however when run under the Mac O/S:).

```
Now Bryce2, that's a bitchen app. If you haven't seen
Apex Media or Rainbow Multimedia on a Falcon, the
Bryce interface will give you a good example.
To bad Bryce2 is also available for the PC.
I can still purchase quality apps and use a Hades
with a Pentium card. Screw the cost.

Mike

Yup, Get mint with minix or magic with VFAT.
That will work. bye :)
However the desktop from thr ROM can not display the longfilename
correctly.
You woudl need an alternative desktop.
However Magic comes (I believe) with it's own desktop.

Well, you could either get Magic which uses the Windows 95 VFAT filesystem (crap, crap, very crap) or you could get MiNT with Minix and have a proper filesystem which is very, very fast. Both offer long filenames. Magic costs money, whereas MiNT and Minix can be downloaded from any good Atari FTP site.

Cheers,

James Cox.

Are you into HOT CHAT? We've got the world's largest voice-personal dating system, as well as the hottest, sexiest "1 on 1", "2 on 1", and "PARTY-LINE" chat you'll find anywhere, all in one place! And you don't have to call a 900 number to get in on this hot phone fun!

You can choose from 5 hot programs that are sure to fulfill your every desire!

You can press 1 from the main menu to choose from our sexy "1 ON 1" PLEASURE MENU, then:
*to talk to a BEAUTIFUL SEXY GIRL, press 1.
*for a 1 on 1 session with an experienced DOMINANT MISTRESS, press 2.
*for steamy talk with a LUSCIOUS TRANSVESTITE, press 3.
*for an erotic 1 on 1 chat with an EXOTIC TRANSSEXUAL, press 4.

*for some man to man action with a HOT GUY, press 5.
You'll be billed just $3.99 per minute for your selection.

Or you can press 2 from the main menu to DOUBLE YOUR PLEASURE, then:
*to speak to 2 HOT SEXY GIRLS, press 1.
*to get it on with a swinging WILD COUPLE, press 2.
You'll be billed just $4.99 per minute for your selection.

Or you can press 3 from the main menu to join the GROUP ORGY LINE!
*You can party with the nations nastiest swingers for only $2.50 per minute.

Or you can press 4 from the main menu, then:
*Press 1 to join the FANTASY NETWORK. This is the world's only phone service that allows you to connect with people who share your personal fantasies. This state-of-the-art voice mail system lets you listen to messages from beautiful girls, sexy transvestites and she-males, gay and bisexual males, and dominant women. Leave them a hot and sexy message, then call back to see what erotic message they have left for you. You'll be billed just $3.50 per minute.
*Or press 2 to listen to a hot selection of recorded fantasies steamy enough to make you explode! Choose from beautiful, sexy women's fantasies or domination stories. You'll be billed just $2.49 per minute.

Or you can press 5 from the main menu for the HOT AND NASTY DATELINE, where you can listen, and respond, to voice personal ads from hot horny girls in your neighborhood, including their real names and home telephone numbers! You can also leave your own personal message for people to get in touch with you. Make new friends on the world's busiest voice personal lines! Meet singles or couples, gay or straight; you'll be billed only $2.99 per minute.

***JUST CALL 1-800-756-3906 to use your Mastercard, Visa, or American Express card. The charge is just $2.49-$4.99 per minute, plus a 50 cent connection fee. 18+ only.

***OR CALL 1-900-745-4398. The charge is just $2.49-$4.99 per minute. Must be 18 years of age or older.

Thank you for replying. Just found this group tonight and saw both posts. I dug out the ST 520 and hooked it all up. Works real well except there is a problem with the B drive, which apparently has always existed. I think it said something to effect of can't read from drive b or something. At any rate I was fascinated by the basic language sourcebook since I am into the variations of basic programming. As near as I can tell this was Visual Basic before Visual Basic. Mr. Bill sure copied alot of the features, drag and drop, resizing of windows, etc... Incredible that atari apparently blew it the way they did.
Ah, pity that.
Dan

523. CD-R Media for sale at really low prices

Newsgroup: comp.sys.atari.advocacy
Date: 1997-02-10 00:00:00 UTC
From: forth@fifth.com
Message-ID: <5dna6f$1eh@dfw-ixnews5.ix.netcom.com>
Source record: 6568

We have the following CD-R media for sale.

Brand: Pioneer
Type: Printable Media (Surface is blank for printing or labels)
Type: Gold on Green
Size: 74 min (650 mb)
Price: 6.99
Minimum Order: 10

Brand: Maxell
Type: Gold on Gold
Size: 74 min (650 mb)
Price: 6.55
Minimum Order: 10

Brand: TDK
Type: Gold on Green
Size: 74 min (650 mb)
Price: 6.55
Minimum Order: 10

Brand: Hewlett Packard
Type Gold on Gold
Size: 74 min (650 mb)
Price: 7.15
Minimum Order: 10
Lifetime Warranty

The Copy Cat Shop has all your CD duplication, replication, recorders,
software, and media needs.

If you have any questions feel free to call.

Cordially,

The Copy Cat Shop

In Singapore, it's worst!

The government have a proxy which filters out everything going into Singapore. The government is said to have 5 full timer surfers in the NCB (National Computer Board) whoose job is to search & locate porn sites and add them into the no-no proxy list so that they are blocked.

Last year, a guy was caught by the law for possesion of porn stuff in his harddisk. He was fine over S$50K (S$1.4 = US$1) for 66 pics, I think it was like S$1K per pic, couldn't remember.

Sorry, this is most definitely *not* false information. As a 25-year industry professional working as an AS/400 systems programmer since 1988, I've contacted quite a few AS/400s at sites of all sizes. Such things as service account passwords are often ignored or maintained only by the IBM CEs. Many CEs use the same password at different sites within their territory.

And the accounts he's referring to have no relationship to IPL *nor* the console.

There have been a few new people to the group, and they sure sound
like they have the same flavor as Sinclap under a different name.
Especially all the people wanting TOS images and willing to argue
about getting it. The guy that thinks he is talking about Atari ST's
and seems to be talking about 8-bit machines comes to mind....
I fear he still lurks...dundunt dundunt dundunt dundunt dundunt

IBM plugged these gaps on most of their OS's long ago. Today, the installation
passwords expire in a few weeks and will leave you _totally_ locked out
if you forget to change them.

As for how an individual _site_ manages all of this, that's a different
matter entirely. Discovering that many sites give service machines the
same password as their machine name is no surprise at all and has no
bearing or reflection on IBM. Talk to the security people at the sites
mentioned above and I bet that they either: 1) Do not exist or 2) cannot
spell 'computer' or 3) have no idea that a 'CE' even exists (much less
that a 'CE-Key' exists...

Most security problems are actually internal organization problems,
not 'holes' in the OS.

Yeah, I just recently saw the docs on the VFAT fs in some Linux Howto
file... Tjeez! It's a classic Crap Microsoft Backward-compatibility Patch!
It uses additional entries in the dir table which are sort of masked of from
the normal DOS fs to store additonal characters for the file name. That's
why W95 locks it's filesystems: to prevent properly written programs like
Disk Doctor from messing up (ie. fixing) the "crap" extra dir entries...
Unbelievable...

I suppose nobody tried to telnet to port 135 under NT,
typed about 30 characters and then pressed return and closed
the telnet session again.

And then watched the load on the machine go up to 100% almost locking
the machine..

But that might be fixed now. but things like these can bring down
systems :-((

Why don't you look it up yourself?

Better yet, here, I'll post the text file for you.

DOCUMENT:Q162567 [winnt]
TITLE :Telnet to Port 135 Causes 100 Percent CPU Usage
PRODUCT :Microsoft Windows NT
PROD/VER:3.51 4.00
OPER/SYS:WINDOWS
KEYWORDS:kbnetwork kbbug3.51 kbbug4.00 kbfile

The information in this article applies to:

- Microsoft Windows NT Workstation versions 3.51 and 4.0
- Microsoft Windows NT Server versions 3.51 and 4.0

SYMPTOMS
========

When a client uses the telnet utility to connect to port 135 of a computer
running Windows NT Server, and then types more than 10 random characters
and disconnects, the server CPU usage jumps to 100 percent and does not
come back down until the server is restarted.

CAUSE
=====

This problem is caused by a problem with the remote procedure call (RPC)
components in Windows NT.

RESOLUTION
==========

To resolve this problem, download and install the appropriate file:

Windows NT 3.51

This hotfix has been posted to the following Internet location:

ftp://ftp.microsoft.com/bussys/winnt/winnt-public/fixes/usa/NT351/
hotfixes-postSP5/rpc-fix

Windows NT 4.0

This hotfix has been posted to the following Internet location:

ftp://ftp.microsoft.com/bussys/winnt/winnt-public/fixes/usa/NT40/
hotfixes-postSP2/rpc-fix

STATUS
======

Microsoft has confirmed this to be a problem in Windows NT version 3.51
and 4.0. A supported fix is now available, but is not fully
regression-tested and should be applied only to systems experiencing this
specific problem. Unless you are severely impacted by this specific
problem, Microsoft recommends that you wait for the next Service Pack that
contains this fix. Contact Microsoft Technical Support for more
information.

KBCategory: kbnetwork kbbug3.51 kbbug4.00 kbfile
KBSubcategory: nttcp NTSrvWkst
Additional reference words: Telnet RPC crash hang max 3.51 4.00 prodnt

OR LIMITATION OF LIABILITY FOR CONSEQUENTIAL OR INCIDENTAL DAMAGES
SO THE FOREGOING LIMITATION MAY NOT APPLY.

Copyright Microsoft Corporation 1996.

Good enough?

Maybe you should tell your NT sysadmin about this fix.

As I recall, a fix was available less then 24 hours after the problem was reported.

The only other OS I can think of that gets fixes this quickly is Linux. :)
(BTW Linux rocks!)

I am selling my Atari Lynx and the following games and accessories:

APB
BLOCKOUT
BATMAN RETURNS
BLUE LIGHTNING
CALIFORNIA GAMES
CHECKERED FLAG
CHIPS CHALLENGE
ELECTROCOP
GATES OF ZENDOCON
GAUNTLET
HARD DRIVIN
HYDRA
KLAX
MS PACMAN
PAPERBOY
PINBALL JAM
PIT FIGHTER
ROADBLASTERS
ROBOSQUASH
RYGAR
S.T.U.N. RUNNER
SHADOW OF THE BEAST
SHANGHAI
TODD IN SLIME WORLD
STEEL TALONS
VIKING CHILD
WARBIRDS
XENOPHOBE
ZARLOR MERCENARY

AC Adapter
Car Adapter
Deluxe Carrying Case

Bid High to make sure of recieving games! I will knock down price for
people who buy more!!

To check on current bids, check out my page:
http://msm.byu.edu/complab/joshuam/lynx.htm

Bids and questions to: 0jmorrel@msmlab.byu.edu

The Lynx II comes with the Original box. All games come with Boxes and Manuals. I am conducting an auction, so the highest bidder wins. Bidder will send me a money order for shipping and merchandise before items are shipped.

[Image]
Welcome to my Atari Lynx Auction page!!
I am currently conducting an auction of the following Atari Lynx items. I will post all bids daily, so keep checking my page often!!
All games come with boxes and manuals. Here are the games:

APB $5.00
BLOCKOUT$5.00
BATMAN RETURNS$5.00
BLUE LIGHTNING$5.00
CALIFORNIA GAMES$5.00
CHECKERED FLAG$5.00
CHIPS CHALLENGE$5.00
ELECTROCOP$5.00
GATES OF ZENDOCON$5.00
GAUNTLET$5.00
HARD DRIVIN$5.00
HYDRA$5.00
KLAX$5.00
MS PACMAN
PAPERBOY$5.00
PINBALL JAM$5.00

VIKING CHILD$5.00
WARBIRDS$5.00
XENOPHOBE$5.00
ZARLOR MERCENARY$5.00

Check out Kurt Olson's Lynx page for reviews on each game!!
[Image]Click here!!!

I also have the following accessories for auction:

Lynx II$5.00
Deluxe carrying case$5.00
AC Adapter$5.00
Car Adapter$5.00

Bid high!! If you buy more, I will knock off some from the price!!

Please send all bids or questions to:
0jmorrel@msmlab.byu.edu

I reserve the right to make the final decision on selling price. I will calculate shipping, and buyer will send me a money order for shipping and equipment before they are shipped.

536. GIF, JPEG scanning service. FREE OFFER! A pictures worth a thousand words! (ZrQHpU)

Newsgroup: comp.sys.atari.advocacy
Date: 1997-02-13 00:00:00 UTC
From: scanning@XXX1324noreply.com
Message-ID: <Op5U8BgG8GA.134@uptgmsnb01>
Source record: 6581

Why don't you print or save this info in case you need it in the future?

Hello Friends,
It's time to take full advantage of the online medium by having your photographs scanned today! Once your pictures are scanned into one of three formats (GIF, JPEG, or BMP) you can do many exciting things with them.

-You'll easily be able to attach them to emails and send them to people your chatting with online. No more having to try and explain what you look like!

-You can also use your photos in all kinds of fun projects: build web pages; design your own greeting cards; make personalized stationary,desktops, and screen savers- the list is endless!

- Scan pictures of yourself, your pet, your vacation, or whatever you choose!

Cyber Services will scan ANY photograph, drawing, magazine clipping, or other artwork to an image file, and email or US mail it (on disk) back to you within 24 hours of its receipt. (You must be able to receive file attachments to get your file(s) via email. Check with your ISP if your not sure.) PRIVACY & CONFIDENTIALITY ARE ASSURED. You'll also receive helpful technical tips on everything from renaming your file to saving time when sending it to people via email.

We scan all our images in 16.7 million colors for best quality. For just $1 extra we can enlarge or crop your photo, blur out a body part, or ad text (such as your name or email address).

Best of all, as a FREE GIFT to you (limited time only), IF YOU CHOOSE TO, we'll reserve you a FREE PAGE (or pages) in our "Internet Date-Site" (Now under construction!!!). This web site contains pages classified by local area and sexual preference. There's also a erotic image gallery (must be legal age to enter), and a "special interests" section. That's right, you can have your own page on the internet for just $4! (Note: You're responsible for answering your dog's email!) Your free page(s) will include any or all of the following: Your scanned photo(s) (You pick which ones- You can have some, none or all of your photos posted on your page), your email address with an icon visitors can click to send you mail, and a brief profile about you. We'll remove or modify your page, at your request, at anytime! When the "Date-Site" opens for business, you'll receive an email notifying you of the address of your personal web page. You can give the address to people and they can view it from any internet
connection! There are millions and millions of people on the internet.It's

time you start meeting them! (This service won't be free for long so act now!)

If you have any questions regarding our services, please call us at (541)744-5718.

Ordering Information:

Price: $4 for first scan, $3 for each additional scan
Extras: $1 each to add personalized information. (name/email)
$1 each to have image modified (enlarged, body part blurred, etc..)
$2 to have image files mailed to you on a floppy disk (IBM or MAC).
$1 credit card processing fee (Visa/Mastercard users only)

If you would like your photographs returned to you please include a self addressed stamped envelope. Otherwise they will be destroyed.

Order Form (PRINT OUT or COPY CLEARLY):

Name (optional):

Email Address or Screen name (PRINT CLEARLY! You must be able to receive file attachments. Otherwise include $2 for shipment on floppy disk.):

Address (optional unless having shipped on disk):

Phone number (optional):

File type (GIF, JPEG, or BMP. GIF recommended):

Extras (Exact personalized info you want printed on scan):

Disk Format (if having mailed on a floppy): IBM or MAC

Payment method (Cash, Check, Money Order, or Visa/Mastercard):
Please make checks payable to Cyber Services.

Credit Card # (credit card orders only):

Expiration date:
Don't forget to include the $1 processing fee if your paying with your credit card.

Do you want the FREE GIFT? Yes or No (circle one)
-Web Page(s) in our "Internet Date-Site" (under construction). You can have a page for yourself, a page for your car, and a page for your cat! Be sure to indicate where you want your page (F4M, M4F, F4F, F4M, or Couples) and which of the following info you want on your page (print clearly): State and Town, email address, year or birth, physical description, quote/message (under 30 words please). Please indicate which photos you want on your page (if any) if you don't want them all to be displayed. If your want your nude/erotic photos displayed in our erotic image gallery YOU MUST include a signed statement that your are over 18 years of age or older and give us

consent to display your nude/erotic photo, and be sure to tell us if your want it displayed with your info or anonymously.

Mail the above information and photos with payment to:

Cyber Services
2852 Willamette St. #131
Department 1
Eugene, OR 97405

Orders sent overnight will be given first priority.

Erotic/Nude photo's will be accepted providing everyone in them is of legal age.

Questions? Call (541)744-5718

Please help our small business grow by sharing this info with someone you think could use it.

Thank You!

(ZrQHpU)

From: Brian-Roland Miller <brmiller@tiac.net>
Message-ID: <3305D14F.1222@tiac.net>
Source record: 6585

A friend returned from Comdex and was talking about his experience. He said, in a room of
new Intel processors, nothing worked, everything
overheated, software froze up. He was
surprised.

Talking with his friend/computer publisher who saw all this
with him, he asked, 'So what
will you report about this?' The publisher said: 'If I said
anything much against Intel or
Microsoft, I would be unemployed in a few months.'

This guy publishes Computer Reseller News out of Long
Island. He knows one just
doesn't criticize the money tree. Shake it when they say
shake -- and the money will fall.
That's life. It may have been obvious to anyone who has
tried to read the computer press
these many years (in between barfs) that these experiences
are typical. But they still greatly
disturb. [posted 27 November 1996, submitted by Alan

If you could name me a single OS which has never had any fixes, then
I'd grant that you have a point.

Your poor sysadmins have repeatedly shown they really aren't very well
acquainted with NT, nor do they stay current. Giving you more than a
guest level account is proof of this.

Actually they know NT very well -- maybe more well than you do.
The head guy has worked for Microsoft for several years,
including working on the OS (not apps).

There are just too many little things to do getting a whole lab
full of NT set up, apparently -- at least a lab where students
come in and abuse the computers.

And I know you are so concerned about this, but I have had an NT
user account for some time now. But I prefer to boot into DOS
from my NFS boot disk... NT locks up when I try to play certain
games.

A 'quality OS' can frequently have these problems...or will you suggest Linux isn't a quality OS? There are bugs and security flaws in _any_ OS. Patches fix those bugs, and a measure of the quality of the vendor is the speed at which those are addressed if they are real problems.

>Actually they know NT very well -- maybe more well than you do.
>The head guy has worked for Microsoft for several years,
>including working on the OS (not apps).

That means nothing. I also find it hard to believe that a programmer of Microsoft operating systems is now working as a (lowly, by comparative standards) Sysadmin for a local college(?) unless he *really* screwed up his old job.

>There are just too many little things to do getting a whole lab
>full of NT set up, apparently -- at least a lab where students
>come in and abuse the computers.

Quite frankly, if they're set up properly, which any NT-familiar person can easily do, they should be next to impossible to screw up unless someone *really* knows what they're doing, or has a copy of DOSNTFS lying around.

Also, if it's set up properly, getting updates to a wide variety of machines, especially assuming it's the same update to all machines of a given class, is *trivial*.

In other words, it really sounds like your SysAdmin has no idea of what he's doing.

DL> Maybe he's just overworked, then. Troublemakers like you don't make
DL> his job easier. Your school goes to a lot of expense to have
DL> resources like that, so you abuse them.

Depends what you call abuse.

a) trying everything to bring the network down
b) play network games
c) load the machine with some hires raytracing
d) suck up lan`s bandwith by having about 25 IE`s open

>>There are just too many little things to do getting a whole lab
>>full of NT set up, apparently -- at least a lab where students
>>come in and abuse the computers.

DL> It is about the most hostile environment I can think of. Good thing

DL> and the first time you started tossing off denial of service attacks,
DL> I'd have you thrown out of school. After the first couple of games
DL> you pulled, I'd pop up a message box when you logged in that said "I'm
DL> watching you". I had my network patched against the port 135 attack
DL> less than 24 hours after it was reported. I also posted a work-around
DL> to various security lists before it was patched.

You may have done so, but the 3 different NT machines I had
the chance to get my hands on had not..
And not so dangerous are the bugs that are publicly known
(and will be fixed sooner or later)
but the unknows bugs that hackers keep to themselves so they have
a foot in the doorway ...

>>And I know you are so concerned about this, but I have had an NT
>>user account for some time now. But I prefer to boot into DOS
>>from my NFS boot disk... NT locks up when I try to play certain
>>games.

DL> This is a serious error - there is no way you should be able to boot
DL> the machine from floppy.

There is no reason why it even should have a floppy. Why not get a cheap
intel box, plug in some scsi hostadapter and a scsi Zip drive.. that should
make those happy that need to save a lot of data onto removable media.

DL> I'd make a special "bozo" group just for you - give you write
DL> permission nowhere, and only give you execute permission for solitaire
DL> and minesweeper.

Good job you know your system :) The internet cafe I visited had NT
and we had root access. we could have turned the system upside down
and inside out. (enough "manpower" was available since the 6 of us
are all information science students (all differnent levels))

I guess that some/most people running and administrating some NT
LAN don`t know all the bugs etc etc.. you see :(

546. SuperComputers

Newsgroup: comp.sys.atari.advocacy
Date: 1997-02-16 00:00:00 UTC
From: Dan Cox <village1@lightspeed.net>
Message-ID: <3307916D.513A@lightspeed.net>
Source record: 6492

The other day my dad made a very good point. The only reason that computers for home use are so ridiculously fast is because of the bloatware that is produced for the ibm compatibles. This is very true. To run much of the software you have to have AT LEAST 8 megs of ram AND a pentium pro whatever. Essentially you are running a supercomputer where you shouldn't be having to. I rediscovered the atari 520 st and am reassured in my belief about bloatware and supercomputers. I use datamanager and st word writer on the st. These are fabulous programs and run perfectly well on my floppy drive driven 8 mhz 512k computer. Try running pagemaker on something similiar! For the atari I have heard of PageStream which would run on the 1meg machines. This is how it should be. You should not have to pay ridiculous amounts of money to buy a supercomputer so you can run software that is difficult to use and doesn't produce(easily) what you want.

This sort of argument works only as long as you don't think about how bloated the ST is compared to its predecessors. I remember magazine articles proclaiming that 64K was more memory than anybody would ever need, when all three of the major 8-bit computers started shipping that much (Atari, Apple, Commodore).

Also, a major factor which drives the power and memory capacity of home computers up is games. If there were any texture mapped 3D games on the ST, you would quickly discover why an extremely fast CPU and lots of RAM are absolutely required. Twenty years ago, it really would have taken a supercomputer to run something like Doom, and Doom itself is getting a bit dated these days.

From a certain perspective, both your dad and the folks who said that 64K was enough are correct. That perspective basically says that new computers are only good for running old software. However, extra CPU power and memory allow the inclusion of features in newer programs which are simply impossible to have on the older generation of machines.

Mind you, I'm not advocating program bloat. There are clearly many programs which are much larger and slower than they need to be (most Microsoft products fall into this category). But to say that all the power and memory capacity of modern computers is worthless is simply false.

> ...extra CPU
>power and memory allow the inclusion of features in newer programs which
>are simply impossible to have on the older generation of machines.

If you haven't used st word writer, you should really try it. It's a heck of alot better than word for windows, and it runs in 512k. That's how software should be. This ibm compatible is an 8meg dx2 66. I can't see doing anything that possibly could not be appropriate for this machine. Word runs just fine and so does win95. People forget there roots when they say you've got to have 32megs running at ppro 200. When win 3.x came out it was sold on 2 meg machines with sx 25 cpus. If software is written efficiently then it can still have just as many features(even though most are uneeded anyway) and run perfectly well.
P.S.
My dad refuses to upgrade, and still runs Accounting II plus, on his apple II plus. The reason being is that it's fast, it's incredibly easy to use and IT JUST WORKS! (And it's kept on working for 16 some odd years).

It is about the most hostile environment I can think of. Good thing
for you that I'm not your sysadmin. I'd log every damn thing you did,
and the first time you started tossing off denial of service attacks,
I'd have you thrown out of school. After the first couple of games
you pulled, I'd pop up a message box when you logged in that said "I'm
watching you". I had my network patched against the port 135 attack
less than 24 hours after it was reported. I also posted a work-around
to various security lists before it was patched.

>And I know you are so concerned about this, but I have had an NT
>user account for some time now. But I prefer to boot into DOS
>from my NFS boot disk... NT locks up when I try to play certain
>games.

This is a serious error - there is no way you should be able to boot
the machine from floppy.

I'd make a special "bozo" group just for you - give you write
permission nowhere, and only give you execute permission for solitaire
and minesweeper.

You must not consider *any* OS to be a quality product then. Take a look at the list of bugs for SunOS, Solaris, AIX, etc. You'll be amazed. Search the web for the list of security holes in Solaris or SunOS, if you haven't already. Check out IBM's AIX web site and browse the fixes directories. AIX 4.1.4 was unusable in the state it was shipped to us as soon as you enabled NFS. I had to download over 70 separate patches to get the OS stable for my labs. I consider all of the above OS's quality products; even NT. I don't expect any OS to be perfect.

What about BeOS or QNX? I haven't heard of many problems with
them. Still, it is pretty obvious that most of the common OSs
could have quality improved by huge amounts.

I did what through e-mail? The only mail I sent you was an article you posted in this newsgroup, several copies:).

No, I was not read the riot act. I was very nicely asked to not send mail to you anymore if you did not wish it. I complied. We have a pretty decent provider here, and after sitting in on a few of your post, all he could say was that we needed a moderator. I thought we had one, but somehow you have put fear in him. If I could figure out what he did to you a while back, fear not, your post would not apear here, nor your email arrive at my private email address. I don't like you or any crap you post. The other Mac advocates at least have a knowledge of their systems and know somewhat about computer hardware. The defend their statements with facts and admit when their wrong. You do none of these. You, Sir, are just a shit brewer.

No, the slow server is at your end. No filtering on this end. If your just seeing that post, you have had your head up your ass for quite some time.

Michael

P.S. I hope everybody takes note of the new mail address for Mr. Sinclap. It's to late to send him a Valentine, but Easter is on its way.

I never understodd the NeXT acquisition, Apple could have bought BEOS for $300 mil and had an OS, instead they spend $400 mill, buy NeXT and still have no OS, now they have to make $400 mill in cut-backs and still no OS, in a few months they may have an OS but whats the point, by then they will have lost more and more of the market.

Schools are all going to the Wintel platform, the corporate mentality is that if it don't do Intel and Windows they don't touch it (unless its UNIX) and the home market has all but gone the Wintel way as well. DTP publishing is faster on a Pentium Pro these days with PageMaker then on a Mac, they have little left.

Not a very fair end to a superb 10 years ahead of its time computer system. Gee sounds like the Atari 400/800 computers doesn't it? Computer so way ahead of their time, Warner didn't know what to do with them or how to sell them. Even the ST's with TOS was fantastic machines (TOS could've still used a little more brushing up in the user friendliness area's) but they were incredible machines, the only problem, they didn't say 2 things on the case: Intel Inside and Windows Ready. The whole world revolves are Microsoft and Intel, its really just annoying.

Curt

The BeOS would not be acceptable in its current form. It has no printing
support, a very raw GUI, applications need to be recompiled at every OS
revision, no backwards compatibility and it doesn't support key Apple
technologies. Neither purchase would have resulted in a ready to use OS.

>Schools are all going to the Wintel platform, the corporate mentality is

But NeXTStep is UNIX.

I doubt it and Apple still rules in most for money color publishing and
graphic art firms.

>To run much of the software you have to have AT LEAST 8 megs of ram AND

In clones, the essential problem is lack of RAM.
The newer cloner OSes are too big for their britches.
Even the relative runt 'Windows 3.1' required 8 megs
to even be usable; 4M+Win31 = Sub-ST. And even at that
level, clones are crippled. You will be depending on
the HD to allow you adequate memory to run your programs.
That will tend to make your system run at the speed of
disk.

Even Linux developers admit that too much dependence upon
virtual memory is something that will adversely effect
performance. Win3.1 was a VM junkie. The rest are worse
as they're bigger.

CPU speed is not that critical. If it is, you'd likely be just
as well serviced by a PlayStation.

Without enough physical memory, your system will never get the
opportunity to show you how slow it's cpu is.

Even a slow ST trumps a fast hard drive.

According to the wife, this DX4/100 sped up by 10x when I
did nothing more but increase the physical ram from 8M to 32M.
She still suspects that I upgraded the cpu without telling her...

Apparently they weren't paying attention to any of the HLL coded,
portable, layered operating systems floating around larger systems.
Niether were they paying attention to GDI's, VDI's, GUI's or
multitasking.

GEM's 200K of bloat added these to varying degrees.

A part of the shift from the XE to the ST were some revolutions
in microcomputer terms. An ST is not quite the souped up yet bogged
down speedster that a relatively spec'ed clone would be.

A clone with a 'mere' 10x the RAM of an ST would be a crippled
swapping dog. Very few GUI's would run acceptably well on mere
5 Megs.

For anything not too reminiscent of an ST you'd be primarily stuck
runninng QNX, GEOS, or GEM.

Even then, once you up the ante to ~30-40x ST standard memory, you've
only got a more sophisticated copy of the ST multiplied.

If you can do more than a few things at once (6 DA's you know) then 10
years of progress hasn't bought you quite that much. It's evolutionary

progress at best.

Yes, exactly. If more people looked at what the big machines are capable
of, they'd know why it's useful to migrate those features down to the
desktop, and why it's silly to proclaim that a certain level of CPU power
and memory is all anybody could want.

> GEM's 200K of bloat added these to varying degrees.
>
> A part of the shift from the XE to the ST were some revolutions

> down speedster that a relatively spec'ed clone would be.

Are you kidding me? There were no architectural innovations in the ST.
It was basically a 68000 bolted to a bunch of standard peripheral devices,
with as little custom circuitry as possible. It reeks of being basically
the same thing as the 8-bit series, only with larger constants everywhere
(more memory, larger and faster disks, faster CPU, higher res graphics).

The 8-bit was, in several respects, a much more original design. For
example, the ST had a simple and boring frame buffer. The 8-bitters had a
graphics controller with built-in sprite support, and a considerable
amount of reprogrammability that allowed programmers to mix and match
graphics modes.

Despite that, the greater CPU power and memory of the ST allowed much
better games and productivity programs to be written for it. The memory
size alone allowed the basic graphics resolution and color depth to be
much better.

If people had stuck to writing 8-bit style programs for the ST, it would
have never been worth anything. They didn't.

> A clone with a 'mere' 10x the RAM of an ST would be a crippled
> swapping dog. Very few GUI's would run acceptably well on mere

> 5 Megs.

Incorrect. Current versions of the major GUI operating systems don't run too well in that amount, but versions designed in the days when 4 to 8 MB was the normal memory size for new computers did.

My mom uses System 7.0.1 or 7.1 (can't remember which) on a PowerBook 100, with 2 MB RAM and a 20 MB disk. It works fine.

Only as long as you stick to using software that doesn't try to take advantage of the large memory size.

> If you can do more than a few things at once (6 DA's you know) then 10
> years of progress hasn't bought you quite that much. It's evolutionary

Atari ST desk accessories were never anything like actually having several full applications open at once.

>>Also, a major factor which drives the power and memory capacity of home

> PC's have always been rather poor games machines, especially
> mindless shooters...

PCs are considerably better than consoles for many types of games. For example, mindless shooters. There's nothing more mindless than Quake, they designed it that way on purpose. And it's really good.

Quake, incidentally, requires about 8 MB RAM. This is not because the game is inefficient. It is because you can't fit the working data set of the game into anything less. There are console versions of Quake planned, but I predict that they will suffer from having to be crunched down; no console of today contains more than about 4 MB of RAM.

> for FAR less?

Besides the kind of games you can't get on a PlayStation, it would buy you
the ability to run lots of serious software with far greater capabilities
than you could get on an Atari.

You might not need those capabilities. If so, don't buy them.

> As of yet, the best you can come up with is is games.
> Just get a Saturn and save yourself the expense of a
> 2k games machine. You've not even bothered to attempt to

I don't intend to. I have at no point attempted to state that people who
are happy with what they've got should change. I am merely trying to
point out that being happy with what you've got doesn't justify slamming
newer software and hardware. It's a strange thing; for some reason people
seem to feel a need to justify their ownership of an orphaned computer by
trying to prove that it's better than anything ever made.

>>Mind you, I'm not advocating program bloat. There are clearly many

When you try to lambast something, it helps if you get some basic facts right:

Operating systems do not force programs to use more resources. It would
be a very odd operating system which effectively told a program "use more
of that disk, or I kill your process now!".

Comms programs don't take up 5 megs. The terminal program I use, ZTerm,
uses a grand total of 440K of RAM. I think that's fairly close to what
STalker, my term program of choice on the ST, used.

Word processors don't take up 20 megs. Even Microsoft Word 6.0. (5.1a is
actually very compact, running in as little as 512K.)

Then please give a counter example. The above were refering to
Procomm+ and Qmodem as well as Word Perfect and Word 6. Perhaps
you could indicate what nifty things those things do that our
poor Ataris could not do. Or perhaps point us to more austere
solutions that might grant us similar benefits.

At this point it would appear that we either get to cripple our
machines running the latest and greatest or end up running warez
that are no more impressive than our own.

In other words, you agree with my central point. Desirable features can
be added to software, at the cost of increasing size and CPU usage. So
why the hell did you ever start arguing with me? Some perverse need to
naysay anything I write?

>>> A part of the shift from the XE to the ST were some revolutions

OK, I read. You said "A part of the shift from the XE to the ST were some
revolutions in microcomputer terms". I can't interpret this as talking
about software exclusively, because it's such a vague sentence. If you
want to fight illiteracy, learn how to write in a clear and understandable
fashion.

>[Hardware tangent deleted]

What you deleted was by no means a tangent. It basically pointed out that
what made the ST cooler than the 8-bits was software. Software which was
made possible because the hardware had more CPU cycles and bytes.

In other words, I was backing up my original message: that each new
generation of more capable hardware leads to the development of software
which uses it to add new features.

>>> A clone with a 'mere' 10x the RAM of an ST would be a crippled
>>> swapping dog. Very few GUI's would run acceptably well on mere

>
> I wouldn't put up with System 6 on that small a system.

So what? For what my mom does with the machine (essentially it's an electronic typewriter), it is fine. 1MB of free memory is enough to run plenty of useful programs. If you had half a brain you'd realize that what I've been trying to say all along is that different people have different computing requirements. The article of mine to which you so vociferously objected said, more or less, "don't bag on the guys who want the new hardware, they may actually need it for something".

> Win/Mac users have learned to put up with a lot of crap
> for they don't know any better.

Cut out your own crap. I'm really sick of your constant attempts to paint anybody who uses Windows or a Mac as sheep who don't know any better.

Except that when you load it as an accessory, it sticks around forever. You can't quit it to free up its memory. There really isn't any fundamental reason to have accessories. Allowing multiple open applications does the same thing, without forcing the user to decide ahead

of time which programs to use simultaneously.

>>Besides the kind of games you can't get on a PlayStation, it would buy you
>>the ability to run lots of serious software with far greater capabilities
>>than you could get on an Atari.

> Like what? What, specifically, are these atarians missing out on?

Photoshop. Digital video effects editing. Migration of more and more
low-end DTP features into regular word processors. Etc.

>>You might not need those capabilities. If so, don't buy them.
>
> Before we buy them, it might be nice to know what they are?
> Do you even know what they are? Do you even know why it was
> you went to the body banks for your last (I believe) Mac.

Oh, come on! Why do you think Atari put a DSP in the Falcon, and the
capability to have 14 MB RAM? Just to sit there while people ran old ST
programs faster? Or to allow a new generation of programs which used the
DSP to do interesting things?

Modern PCs and Macs have more pure number-crunching power than the
Falcon's DSP and CPU combined. Do you honestly deny that this enables
them to run software with cool new features?

>>I don't intend to. I have at no point attempted to state that people who

>
> In the absence of substantive counter assertions, it is difficult
> to see how those Fujvocactes are wrong...

Don't look now, but "substantive counter assertions" is a fairly funny
oxymoron. Made even funnier by the fact that you use it in a sentence
which is a bald assertion.

> You can't even rationalize your own purchase.

I don't have to. I'm comfortable with the fact that I bought it because I
like having a fast computer to play with. From a perfectly rational
standpoint, I don't need a home computer *at all*. But computers are my
hobby and I intend to make a career out of designing computer-related
systems. So, I have an expensive toy. It's probably no worse than if I
was addicted to model aircraft instead. (Actually, I suspect I'd spend
much more money if I was into that.)

[much snipped because I frankly don't care]

>>Comms programs don't take up 5 megs. The terminal program I use, ZTerm,

>
> I doubt if other MacVocates would agree.

I am not a "MacVocate", a term you seem to have invented to try to insult opponents into submission. Even if I were, agreement would not be required: cold, hard facts speak louder than empty-headed idiots. ZTerm and MS Word 5.1a can each be run if you have about 1/2 meg of free RAM. That is a fact, no matter how much you try to deny it.

I am not going to respond to this thread any more. Get in the last word if you feel that makes you win. I am not going to waste any more of my time arguing with an asshole whose main purpose in life is to propagate flamewars by being deliberately bullheaded.

Taking the 3 highest offers for:

3 Atari Video Pinball Units
Model Number: C-380

Units are cream colored versions, all are in working order. Limit one per inidividual please.

To view one of the 3 Video Pinballs, please go to:
member.aol.com/cvendel/vaporware.html

Please make all offers before 3/1/97. $5.00 shipping will be added onto each unit for shipping.

Curt

Bloat does not necessarily imply any added functionality.
That is the trap that you appear mired in. Furthermore, I
specifically stated that the benefits when going from XE
to ST were much more drastic than going from ST to PC. The
ST sits somewhere around the threshold for an effective GUI
based machine and OS. The next 'leap' has yet to be made at
the user level. Any extra benefits a PC might bring are slight
enhancements to what the ST already has.

Their value when compared to required expense are rather dubious.

>

Memory is not such a problem on the ST. With relatively little
expense, you can have more memory than you can waste.

>fundamental reason to have accessories. Allowing multiple open
>applications does the same thing, without forcing the user to decide ahead
>of time which programs to use simultaneously.

A users typical working set is not such a hard thing to deterimine.
It is a minor inconvenience and not something worth the expense of
a new system if the current one allows necessary work to be done.

New computers are expensive and don't always live up to their
hype. WinMacs crippled by overgrown OSes do give Fujvocates
cause to snicker.

Simple - Sinclap has this incredible knack to go very silent when
it becomes very obvious that he doesn't have a clue regarding Ataris,
or perhaps everything, and shuts up for a period in order to make sure
he doesn't make a bigger bozo of himself. Especially last year, when he
attempted to dis Calamus SL as being "crap" - and then admitted after
some prodding from me that he hadn't ever used Calamus, and his
experience with an Atari computer goes back to around TOS 1. He went
strangley silent for the longest while.
```

569. Question about Computer magazines.

Newsgroup: comp.sys.atari.advocacy
Date: 1997-02-21 00:00:00 UTC
From: Dan Cox <village1@lightspeed.net>
Message-ID: <330E0F56.2256@lightspeed.net>
Source record: 6514

In the old days computer magazines were filled with source code and whole sections involving how to take apart your floppy drive and clean it, then put it back together again. Did they think we were smarter then? Nowadays these same magazines are garbage. They downplay anything that isn't this month's state of the art equipment as being obsolete and worthless. That's rather insulting to a proud dx2 66 owner with 8 megs of ram. What is it with the dumbing down of computer magazines?

Please explain, enquiring minds want to know.
Dan

570. Wild & Wacky Atari Auction #1

Newsgroup: comp.sys.atari.advocacy
Date: 1997-02-22 00:00:00 UTC
From: cvendel@aol.com
Message-ID: <19970222063000.BAA13925@ladder02.news.aol.com>
Source record: 6515

The WILD & WACKY ATARI MEMORABILIA AUCTION #1

Rules and stuff:
---
1. Send all bids to cvendel@aol.com
2. Send your mailing address with your first bid
3. Shipping is extra. I will calculate your shipping charge by weighing
your package and adding $1 for materials - Priority stuff <2 lbs will
be $3 flat. Shipping outside of US will be a little more.
4. Do NOT bid unless you plan to buy - bids may not be retracted
5. I reserve the right to withdraw any item
6. Minimum Raises are as follows:
$1 - $5 ==> .50
$5 - $20 ==> $1
$20 + ==> $2
7. Trades - Always accepted so long as its Atari or made for Atari
If you think you may want to trade, e-mail me your trade list ASAP
and I'll tell you what I'll take in trade.
7. EVERYTHING IS GUARANTEED TO WORK - Unless it says it doesn't work.
Everything has been tested except the Intv carts.
8. If you only want an update for one particular system or want to be
taken off this list, please let me know.
9. Payment should be in US funds. Checks and MO, will
be accepted. I would NOT reccomend sending cash, but some people seem
to
anyway. Checks will be held for approximately 1 week to clear. MO
orders will be sent out right away.
10. This auction will go into the G1,G2, SOLD phase at midnight March 8th.

One final post will be made to newgroups. A bidder who is not
on the update list may bid on a G1 item, but not a G2 item. Any
raise to an item in the G1 or G2 phase will result in the item
staying or returning to G1.

No, they _knew_ we were.

: Nowadays these same magazines are garbage. They downplay anything that
: isn't this month's state of the art equipment as being obsolete and
: worthless. That's rather insulting to a proud dx2 66 owner with 8 megs
: of ram.

Right on, bro! I have the same thing (well, I have a dx4/100, too, but
that's not much better).

: What is it with the dumbing down of computer magazines?

The market has changed. It's gotten younger. Games attract kids,
right? Especially those that look really good. Have you ever seen kids
around 11 or 12 flipping through a computer magazine? They often go
through ranking games on how they look. They hardly stop to read the
reviews in many cases. So, for example, even though Nethack is much
better (IMO) than Diablo, you rarely hear people complain about Diablo
being such a cheap knockoff of Nethack because Diablo looks better.

So the result is that if a game magazine is flashy and contains more
gloss than the others, it wins. For example, PC Gamer's biggest issue,
their December 96, was apparently more than half advertising. You pay
for 400 pages of magazine or so and get about 150 of content. Well,
programming and technical information _isn't_ glossy. It _isn't_
falshy. It _isn't_ easy. So the obvious thing to drop when you're going
for an audience that cares less about content than surface is the
technical stuff.

This really bothers me, though. I look back at my old Analog Computing
issues, and love them except for the fact that they mostly don't apply
anymore because they're so old and the equipment so out of date.
Unfortunately, many modern computing magazines are so focused on what
sells that they forget content.

I don't know what modern "developer" magazines look like, but I suspect
that it'd be the opposite of what I'm looking for; people who are not so
much hackers as they are card wallopers who made a big effort and did
something possibly notable (see The Jargon File for definitions of both).
I don't want high end content indigestible for all but the high end, I
want high end content written so that everyone can understand and become

interested. That's the only way we'll ever break free of the horrible restraints imposed upon us by those (like Micro$oft) who think they know better.

I think the thing I liked best about the old magazines was that they instilled you with a sense of freedom. If you didn't like an aspect of a program that they provided, you had the source code. You could change it. You wern't restricted. Now people make a big thing of being able to create new levels and change some aspects of the game. It's horrible that it's been reduced to this level, but hopefully someday this nightmare will end.

Daniel F Boese <boese@badlands.NoDak.edu> writes:

>

You may have a point in saying that Win95 doesn't suck, but you really need to get your facts straight before you post something like this to a group like this. You have some major facts wrong:

> 3. Upgrade your motherboard to dual Pentium Pro 300s.

This is simply wrong. You may have a motherboard that is upgradeable to dual processors, but Win95 won't take advantage of it. If you do add a second processor under Win95 the only thing the processor will be doing is sucking up power. Also, a Pentium Pro running Win95 is acutally slower than a straight Penitum running Win95. The reason for that is because Win95 is a 16/32 bit OS, major parts of Win95 are 16bit. Penitum Pro's are true 32 bit processors. This means that a Pentium Pro has to emulate a 16bit processor to run 16bit code. This make the Pentium Pro slower when running 16bit code.

Now if you did want to use two Pentium Pro Processors, you could use Unix, OS/2 MP, or if you wanted a MS OS Windows NT. Windows NT has the capiblities to use two Processors, and since it is a true 32bit OS it will run faster on a Pentium Pro than on a Pentium. The downside is that many older DOS and windows based programs won't work under NT.

>*Windows 95, Microsoft, MS-DOS, W95 are all probably registered
>trademarks of Microsoft Corp.
>

Well just to end this, I don't mean to nit pick but you did have several of your facts wrong. I just wanted to point out that ALL OS's SUCK. In one way or another, they all do. No "perfect" OS will ever be made, so don't take it personally when someone say's your OS sucks, it just sucks for them.

A primary reason some OSs don't have publicized holes is simply that they
haven't been subjected to wide attacks yet. The more they show up on the
Internet, the more holes will be made public.

I agree 200%!
It's not just the Magazines!
The user manuals (if you even get one) are simple plug and play phamplets.
They tell you nothing about the "language" a device uses...commands, or
anything along these lines...so If you want to use product X with computer
Y, you can't build your own drivers and such without paying big bucks for
a "development" kit!

Not to long ago, I purchased an Epson AL100 laser printer to hook up to
my Atari STe (now a falcon). This little printer could easily prove a
valuable addition to a Unix set-up since it is very "networkable". BUT it
came with two disks...one for MS-DOS, and one for Windows which contained
the drivers and set-up stuff. I had to write Hewlet Packard and pay
almost $200 for a PCL 5 kit to write drivers to take advantage of this
nice little printer! Yes, there were some HP Laser drivers around that
would work with the printer, but none that took advantage of the cool
"laser printer features" like soft-fonts, power save, toner save, memory
compression, etc...

Several years ago, I got an Epson LQ, and the manual contained every code,
and an explination of how it worked! If one wanted, he could send codes
or write drivers on his own that'd make this little printer sing!

BTW, am I missing something...
I recently got a brand new IBM Aptiva with a 200mhz Pentium processor.
It came with Windows 95...and I can't seem to find a basic interpreter,
a logo program, or anything for making basic little custom utilities!
Maybe it's there...but I can't find it to save my life! Maybe if
Win 95 came with a manual that explains anything that isn't "OBVIOUS".
Do they think people are to stupid to write scripts and programs?
Do they think there's no need?
Nah...more like they'd rather bleed us dry...make you have to buy an
expensive compiler/kit or hunt down some commercial made utility that
"might" do what you want for a "moderate" price!

BTW, I still use my Falcon for real work...
I simply wanted more multi-media access, which the Falcon just can't
deliver. I looked at a Mac...but the places I looked weren't at all
serious about selling one to me. They had no litereature about the
systems that I could study, and no one working at the Mac dealers I

tried could answer any of my questions. One sales guy told me to go
BUY a copy of Mac World! I looked at an issue, and found nothing
stating the different systems avilable, and the specs for them.
The PC guys on the other hand gave me a stack of literature that weighed
in at about 15 pounds, and they were able to answer my questions...they
were also willing to toss in software, swap stuff around, and make sure I
got what I wanted. I think I really wanted a Mac...but after putting
up with lame to non-existant "local" support on the Falcon...I decided
I'd rather not go through it all over again, so I gritted my teeth and
brought home a "Big Blue - Intel Based - MicroSoft driven" PC so my
wife would have a PC at home, and so I could browse the net 90's style.
All said and done...I like it...it's nice to be able to talk on an
internet phone, tune into real audio servers, and play high quality true
color animations and video compression schemes. I don't like the price
though! If decent software were out there...I'd much rather have simply
gotten an AfterBurner and done this stuff on my Falcon for less than a 5th
the cost of my PC! Well...such is life...I still use the heck out
of my Falcon for Digital Audio...it meets my specs for now...maybe
when the PC's drop "A LOT" in price, and my Falcon dies...I'll consider
getting something else for the studio...but for now...can't really say
I've found anything "WORTH THE COST" to entice me to leave the Falcon
any time soon where digital audio is concerned.

For some perspective, consider that the very first personal microcomputer, the Altair, was sold in kit form. You got complete circuit schematics to it, and had to build it yourself. If you wanted to connect a peripheral, you would probably have to hack an interface yourself, or buy another kit. It had no OS at all, and BASIC was an extra (which many people never got). The most popular form of mass storage was probably punched paper tape, but it came with no mass storage at all. In fact, the standard Altair came with 256 bytes of RAM, some LEDs for output lights, and a row of toggle switches on front you could use to enter numbers into memory in binary format. To write programs, you had to hand-assemble machine code and painstakingly enter them using the switches.

Ever since the Altair, computers and their peripherals have been steadily changing towards consumer devices instead of hacker devices. In 1997, this means that probably 99% of HP's customer base doesn't need to know PCL 5 codes. So HP doesn't include any information about them with the printer, especially because PCL 5 is probably complicated enough to require some significant manual poundage.

Sorry to rain on your parade, but.

ALL of those operating systems run on one machine, one very personal
machine. Tis not what the WWW runs on. It usually runs on some flavor
of UNIX machine, such as SUN, SGI, DEC, NCR, etc., etc., etc.

But be mindful, there are us out there who have done more, 'tis not
software that makes the machine, but the internal hardware and
firmware structure. And MAC, AMIGA, ATARI, and several others
have the wee-bitty-the-same IBM clones (clowns?) beat to death on that
point.

So why did IBM win the race in the '80s?
Not because it was heavily standrad.
Not because it was easy to use.

BUT because you had to put so few parts in a box to sell a "computer".

And you can take that from someone with these experience factors...

HARRIS JobControl
NCR IMOS I-IV,IRX,VRX
CYBER
UNIX, XENIX (go fork a process!), LINUX
ATARI REV. A,B,C + DOS 2-2.5, DOS3 (HATE, STUPID, GROWL),SPARTA (LOVE)
T/S 1000
APPLE][,][+,][C (wrote a bbs on it),][E,][GS, (and some light MAC).
AMIGA (ever hear of Synabytes or TRSZ?)(Brother of iN7RuDER)
RS MODEL 100, TRS 80 coco II, RS PC-6

And as far as desktop <=$2500.00 machines go, the AMIGA is still the only REAL multi-tasking hard/firm/software machine out there. (Then why am I using a PC compat? Running Weedoze? Because I sold out to that great satan Bill the Gates.)

This guy must be smoking some good stuff.. I got my TT for less than
1/2 of this price.. I'd say about $250 would be a good price for a
system like this, shipped.

581. Wild & Wacky Atari Auction (Update #5)

Newsgroup: comp.sys.atari.advocacy
Date: 1997-02-28 00:00:00 UTC

Wild & Wacky Atari Auction (Update #5)

Rules and stuff:
----------------
1. Send all bids to cvendel@aol.com
2. Send your mailing address with your first bid
3. Shipping is extra. I will calculate your shipping charge by weighing
your package and adding $1 for materials - Priority stuff <2 lbs will
be $3 flat. Shipping outside of US will be a little more.
4. Do NOT bid unless you plan to buy - bids may not be retracted
5. I reserve the right to withdraw any item
6. Minimum Raises are as follows:
$1 - $5 ==> .50
$5 - $20 ==> $1
$20 + ==> $2
7. Trades - Always accepted so long as its Atari or made for Atari
If you think you may want to trade, e-mail me your trade list ASAP
and I'll tell you what I'll take in trade.
7. EVERYTHING IS GUARANTEED TO WORK - Unless it says it doesn't work.
Everything has been tested except the Intv carts.
8. If you only want an update for one particular system or want to be
taken off this list, please let me know.
9. Payment should be in US funds. Checks and MO, will
be accepted. I would NOT reccomend sending cash, but some people seem
to
anyway. Checks will be held for approximately 1 week to clear. MO
orders will be sent out right away.
10. This auction will go into the G1,G2, SOLD phase at midnight March 8th.

One final post will be made to newgroups. A bidder who is not
on the update list may bid on a G1 item, but not a G2 item. Any
raise to an item in the G1 or G2 phase will result in the item
staying or returning to G1.

Hate to rain on your parade, to quote a phrase.

In fact, a PC is a class of machine, not necessarily an OS. I
currently use anywhere from 4 to 6 PC class machines, 486/33 to
Pentium 120. Only 1 of those machines is running Windows of any
flavor. The rest are running Unix, and are being used to do many
things, from serving up web pages on an internal network of around
1000 machines (almost all PCs running Unix) to development work of
GUIs and OS code (drivers, kernel work, etc...)

There are quite a few machines out there which are PCs running web
servers, either running Windows NT, or some version of Unix.

Well Ok, I Hate My IBM windows!!!!!!!!!!!!...Now here is the thing.
I came across a Bit called GEM for ATARI PC. It's a IBM version of
the GEM for the ST. Now, I have a ST, and a IBM. I think it would be
GREAT if I could get the Rest of this GEM for the IBM. I was wondering
if ANYBODY could help. Because I have the startup and Write and Paint
disks for this OS. BUT!...I need the desktop disk! Would anyone out
there know where the heck I could get the LAST disk(s) I need to run
this thing?...I would REALLY like to check this out.

Chris Griffiths.

> >user. Unfortunatly I'm also unemployed because of my boycot towards
> >inferiour mass-market systems, worldwide decadence and lamers!

Whining against the harsh reality of M$'s success in making Win95/NT
and Intel-based PCs won't change a shit. But learning about all the
buglets of the M$ software enough to be able to make wonders out of
any PC shit and being able to debug/configure Win will help you gain
the confidence of those "ignorant lamers" who bought into marketing
skills of M$. THEN you show them how great an Atari is. THEN you show
them how Atari has had M$ floppy/filetype format 10 years before the
power Macs did. THEN you can convince them that "power without the
price" really exists.

> >So for "employers" I am the "bad" guy... just because I'm different!
> >Just because I am NOT an assfucking lemming!Unfortunatly I'm also
> >unemployed because of my boycot towards inferiour mass-market systems,
> >worldwide decadence and lamers!
>
> Sounds more like you're just whining. If you're bocotting the major
> computer industry, than that is your fault, not the industry's.

Read my reply above. Learning Unix also helps. Even something as basic
as being able to Telnet is an important and still rare skill among those
"PC lamers" on top of actually knowing the innards of Win95/NT. If you
ever talk to Lonny Pursel (the guy behind AtarIRC), ask him how knowing
about Unix and PC hardware helps him make a living and remain a valued
member of his computer shop's employees.

> >No it isn't! It's fucking shit these days to work with computers! All
> >those morons and lamers grabbing all the best opportunities just
> >because *they* know which buttons to press on Word for Windows!
> <snip>
>
> >You can't earn a living with "doing what you want to do"!
>
> Actually, sometimes you can.

If you're lucky enough to be in an environment that doesn't single
out individual and sometimes marginal choices, yes indeed. This is
the case of artists like Vince Clarke of Erasure who persistently
used only 20 year old anaolg synthesizers when everyone else would
not settle for any less than a 64 voice multi-timbral synthesizer.
But then, Erasure is selling well enough to allow Vince to have a
brand new studio built for him in Belgium (or was it Netherlands?)

> >Where are the days that you could do something ALONE at your home
> >and gain respect of fellow computerusers?

They are still here. Folks coding internet software for the STiK
layer on Atari are just that: closet heroes of Atari's internet
ventures towards year 2000.

10. This auction will go into the G1,G2, SOLD phase at midnight March
15th.
One final post will be made to newgroups. A bidder who is not
on the update list may bid on a G1 item, but not a G2 item. Any
raise to an item in the G1 or G2 phase will result in the item
staying or returning to G1.

Could you tell me what it is exactly about this that is "Wild & Whacky"?
Apart from your inabilty to cross-post of course.

> * _all_ (and I mean _ALL_) Acorn stuff - Manuals, ROMS, 3rd party stuff,
> software etc be "converted" to America-speak

I don't recall there being any such import restriction. I've got this Monty Python tape here. It's hardly what you'd call America-speak. I've got a PAL VCR, too. It's got documentation in any number of non-American forms. I've also got documentation for some Japanese-made equipment that you would be hard-pressed to call English at all. :) Not to mention there isn't even any such thing as "America-speak" except in slang.

ROMs? 3rd party stuff? Is going to have an impact on importing the computer?

> * Change logo. BBC in the US stands/stood for "Brown-Boverie Coporation",

I'll believe that. A trademark is a trademark... regardless of who owns it, it's still valid in the country of registration...

> approve of.

Couldn't tell you about this, I don't know.

> At the same time Acorn tried to sell in the US, Apple started giving away
> computers in California to stop the BBC sales. The FCC rules were also
> changed.

I would like to see one of these mysterious free Apple computers, or see any sort of evidence for this. I've never heard of Apple computers being given away except perhaps to peripheral manufacturers, etc.

> The BBC was based on the 6502 processor. This was on the "restricted list"
> since it was used in missile firing and control systems. This stopped the

Yet this did not stop the EXPORT of Apple][']s to any number of countries? Nor the internal sale of such computers? Nor the import of foreign- manufactured 6502 chips for use in the Apples?

No, but the import of 6502-based computers was just too dangerous... :)

I hate to join this cross-posted spam, but the last time I used a modem under Windows 95, the program which opened the modem crashed, yet the OS (I use the term loosely, of course) would not release the device. I had to reboot the machine. NT isn't a whole lot better.

These are not systems with which you could run terabyte databases, control industrial processes in real time, manage telephone networks, etc. They are toys for home entertainment and lightweight business management.

>time I tried it on Unix I read about the nine files one had to edit,
>then gave up. It seems to me that Unix is losing market share

Maybe you used a ``plug and play'' type modem. Would Windows NT still find the modem if it was just an ordinary external unit hooked up to a serial port, and if I changed the BIOS settings to give that port an unusual address?

Perhaps you have never used a real workstation with a real UNIX. Adding hardware devices to workstations has been a breeze compared with all the IRQ jumper twiddling of PC's. These computers have had ``plug and play'' long before it became a buzzword in the world of personal computers.

I have here a little booklet from Intel which contains a long list of errata for Pentium and Pentium PRO processors---on other words, ways in which their pathetic processors deviate from *their own* architectural and implementation specs. In the very beginning, they have a disclaimer that Intel products are not to be used in life threatening situations. If you wish, I can quote precisely. There are at least a dozen conditions cited in the book which can cause a dual processor system to lock up. This is all very convenient for Microsoft; they can point their fingers at hardware when something goes wrong.

After skimming through the booklet, I understand why Wintel boxes are so cheap. Apparently, it's not just the economics of mass marketing.

Hmm, maybe your Wintel computer's text editor is not up to the task of trimming the Newsgroups line to include only the advocacy newsgroups? I left in comp.lang.c, since that's where I'm reading this crap.

That's interesting. In OS/2 2.0 (or was it 1.3? i don't remember) If a
Rexx program abended, all open files remained open. You had to reboot to
release them.

> These are not systems with which you could run terabyte databases,

Not any longer it's not, and the Rexx subsystem was always IBM's product.

The point is that 95% of the desktops don't need an OS that canhandle
terabyte databases and industriial process in real time.

That other 5% is handled nicely by OS's like NT, QNX, RNX, Unix, even DOS
can handle real time, in fact many industrial CNC applications are DOS
based.

Nobody is saying that 95 is the perfect OS for everyone, if it were, there
wouldn't be NT.

It's interesting, but nonetheless appropriate, to be comparing problems in
an OS version released several years ago (OS/2 2.0) to Win95, considering
that's how behind technologically Win95 is.

Where have you been?
OS/2 is a product invented by MS. IBM's mistake was thinking they
could do anything with it.

>> These are not systems with which you could run terabyte databases,
>control
>> industrial processes in real time, manage telephone networks, etc. They
>> are toys for home entertainment and lightweight business management.

>Which is 95% of the uses of computers...

And yes, 95% of businesses are using MS products. Thats because 95%
of businesses think they can maintain them with $24K/yr kids,
and are willing to tolerate up times of less the 95%.

William Taylor Wilson <fluffy+@andrew.cmu.edu> wrote:

> there isn't even any such thing as "America-speak" except in slang.

Oh, but there is, much of which is using the same word for two
different meanings. I have the start of a comprehensive list of
these, but a few examples should give the flavour.

In America-speak, there is no distinction between:

to Alternate between two things/states, and various Alternatives.

to Check something and to pay by Cheque

and to /pay/ a Bill (perhaps by cheque!)

Routing an enemy and Routeing a cable, say

to Tire through effort, and a Tyre on a wheel

to go Through somewhere and To a destination

There are also the distinctions between nouns and verbs, for example
to license and a licence

And the distinction between an Ass (a beast of burden) and a Butt
(something done by a goat, with its head).

As can be seen, manuals could need extensive re-writes for the
American market, at least for British products. Perhaps this is one
reason British technology has difficulty penetrating that market.

So what is your point? That what's passable 95% of the time should be
stretched further? 95% solutions don't always cut it. And that last 5%
is a vast canyon compared to the first 95.

602. Wild & Wacky Atari Auction (Update #11)

Newsgroup: comp.sys.atari.advocacy
Date: 1997-03-13 00:00:00 UTC
From: cvendel@aol.com
Message-ID: <19970313062200.BAA20343@ladder01.news.aol.com>
Source record: 6448

```
Wild & Wacky Atari Auction (Update #11)

Rules and stuff:
----------------
1. Send all bids to cvendel@aol.com
2. Send your mailing address with your first bid
3. Shipping is extra. I will calculate your shipping charge by weighing
your package and adding $1 for materials - Priority stuff <2 lbs will
be $3 flat. Shipping outside of US will be a little more.
4. Do NOT bid unless you plan to buy - bids may not be retracted
5. I reserve the right to withdraw any item
6. Minimum Raises are as follows:
$1 - $5 ==> .50
$5 - $20 ==> $1
$20 + ==> $2
7. Trades - Always accepted so long as its Atari or made for Atari
If you think you may want to trade, e-mail me your trade list ASAP
and I'll tell you what I'll take in trade.
7. EVERYTHING IS GUARANTEED TO WORK - Unless it says it doesn't work.
8. If you only want an update for one particular system or want to be
taken off this list, please let me know.
9. Payment should be in US funds. Checks and MO, will
be accepted. I would NOT reccomend sending cash, but some people seem
to
anyway. Checks will be held for approximately 1 week to clear. MO
orders will be sent out right away.
10. This auction will go into the G1,G2, SOLD phase at midnight March
15th.
One final post will be made to newgroups. A bidder who is not
on the update list may bid on a G1 item, but not a G2 item. Any
raise to an item in the G1 or G2 phase will result in the item
staying or returning to G1.

You shouldn't post inflamatory things like this, unless you want
flames. I have found Windows 95 to be a very stable product. I have
been running it for almost 2 years and have not had any significant
problems with it. I recently purchased a 133 mhz Pentium motherboard
and a new case, moved all my drives and cards from the old system, added
a new hard drive and 16 megabytes of RAM. The system booted right up,
no problems.

Unfortunatly, OS/2 belongs to a company I will not buy from. I will not
support IBM in any way shape or form. I am not fond of their marketing
practices (they are actually guilty of, just about, everything Microsoft
has ever been accused of).

Huh? What planet did that happen on? OS/2 was a joint IBM / MS
product. I can't remember who wrote what, but I think MS wrote
PM. AFAIK IBM did most of the work on kernel and OS stuff.

[...]
> And yes, 95% of businesses are using MS products. Thats

Probably true, but the same 95% is probably using IBM
products as well. For one thing, they are probably using
IBM technology in MS products, like OLE.

Another thing to remember is where company critical data
is stored. I have heard numbers like 70% on IBM systems
like AS/400, MVS and the likes.

Try this:

```
{
while (1);
}
```

In the message handler...

I did it (well, not exactly :-)) once accidentially and only Reset
could help.
Actually I don't understand how people can even seriously talk about an
OS that can be crashed by an application with one line of code...

>that's something that can't really be reliably detected.

Exactly. So unless you have a plug and play device, it's safer to just tell the
OS where the port and IRQ is. At initialization time, the kernel can check
for the commonly expected places (e.g. the typically assigned addresses and
IRQ's for the standard two serial ports). On my motherboard, I can set
the address of a serial port to just about anything. The OS would have to
probe the entire 64K port space to try to locate the serial port, in
the absence of PNP.

Only a complete idiot would say that an OS which is taking advantage of PNP
at initialization is more advanced compared to one which has to search
through non-PNP devices. And in any case, PNP is something that just affects
PC's because their architecture was designed by brain-dead IBM folk.
Real UNIX workstations have had the equivalent of plug and play for ages.

The HP9000/725 sitting on my desk labels devices by means of ``hardware
paths''. The ``ioscan'' command will detect and produce an
exhaustive list of all hardware connected to the system:

DESCRIPTION
ioscan scans system hardware, usable I/O system devices, or kernel I/O
system data structures as appropriate, and lists the results. For
each hardware module on the system, ioscan displays by default the
hardware path to the hardware module, the class of the hardware
module, and a brief description.

By default, ioscan scans the system and lists all reportable hardware
found. The types of hardware reported include processors, memory,
interface cards and I/O devices.

```

Interesting that you have been running it for almost two years since it's
only been released for about a year and a half.

I wasn't speaking of anyone's personal experiences with it or its
stability. I was speaking of its technical design, which is still
dependent on DOS.

|

Actually I know dozens of people how have been using it for about two
years.
They were on the Beta release...

So be careful how you try to flame. Take it from someone whose had
to de-footify my mouth a few times myself.

Been there, done that!!

I worked with DOS for years. Though it was just fine.
Then I installed Linux and Xwindows.
WOW! I don't have to three-key my machine anymore! No matter how
stupid my programming mistake was!

I still use DOS, but now I realize there are OS's that are actually
fault tolerant.

People won't realize this until they experience it first hand.

Far be it from me to pick up on grammer but I think you mean defamatory
ie "To speak ill of" etc. The whole idea of advocacy groups is flames,
it's the MCIBTY argument, the whole point is I say computer X is shit
and you say computur Y is shit,t hat's the idea. And it's quite clear
that Win95 is technologically behin, I take it you've nver heared that
saying "Win '95...Mac '89", not that System 7 is particularly superb,
however I do much prefer it to Windows.

I can say the same about my Mac, everything is pure plug and play the
videocard just dropped in and was ready before the configuration disk
had touched the drive and the same with the Zip, Hard Drives etc. It's
fairly stable too, unless you include Netscape but I believe the same
could be said for that on any platform.

617. Wild & Wacky Auction (Final 24 Hours!!!)

Newsgroup: comp.sys.atari.advocacy
Date: 1997-03-15 00:00:00 UTC
From: cvendel@aol.com
Message-ID: <19970315062500.BAA24547@ladder01.news.aol.com>
Source record: 6463

24 Hours Remaining before the Auction goes into the Going Once, Going Twice, SOLD.

This is your last chance to get ahold of some truly unique collectables!!!!!

Wild & Wacky Atari Auction (Final 24 Hours)

Rules and stuff:
---
1. Send all bids to cvendel@aol.com
2. Send your mailing address with your first bid
3. Shipping is extra. I will calculate your shipping charge by weighing your package and adding $1 for materials - Priority stuff <2 lbs will be $3 flat. Shipping outside of US will be a little more.
4. Do NOT bid unless you plan to buy - bids may not be retracted
5. I reserve the right to withdraw any item
6. Minimum Raises are as follows:
$1 - $5 ==> .50
$5 - $20 ==> $1
$20 + ==> $2
7. Trades - Always accepted so long as its Atari or made for Atari
If you think you may want to trade, e-mail me your trade list ASAP and I'll tell you what I'll take in trade.
7. EVERYTHING IS GUARANTEED TO WORK - Unless it says it doesn't work.
8. If you only want an update for one particular system or want to be taken off this list, please let me know.
9. Payment should be in US funds. Checks and MO, will be accepted. I would NOT reccomend sending cash, but some people seem to
anyway. Checks will be held for approximately 1 week to clear. MO orders will be sent out right away.
10. This auction will go into the G1,G2, SOLD phase at midnight March 15th.
One final post will be made to newgroups. A bidder who is not on the update list may bid on a G1 item, but not a G2 item. Any raise to an item in the G1 or G2 phase will result in the item staying or returning to G1.

623. Questions from a Atari french fan

Newsgroup: comp.sys.atari.advocacy
Date: 1997-03-16 00:00:00 UTC
From: roubion@essi.fr
Message-ID: <5gheas$f2i$1@news-srv.essi.fr>
Source record: 6469

I was surfing onto www.atari.com (jag' official web site) and I stopped on this line: "Last updated on February 20th, 1997". I thought that Atari has dissapeared with the JTS merging, but it seems not (because of this updating date). So, let me ask a few questions:

I was told that there are 3 guys left at the Corp: is this true ?
Can anybody tell me what Atari does exactly at this moment ?
What Atari becomes with JTS ?
And finally: is Atari still alive or not ?

(I don't want to get in trouble with anybody here, but just want to know what is really going with the Corp: we're not very well informed in France you know !)

Thanx you !

625. TAF meeting March 19th - Computer Direct!

Newsgroup: comp.sys.atari.advocacy
Date: 1997-03-16 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <332c44a3.0@lagoon.idirect.com>
Source record: 6471

****

COMPUTER DIRECT WILL BE IN TORONTO ON WEDNESDAY MARCH 19th,

AT THE REGULAR MEETING OF THE TORONTO ATARI FEDERATION!

Doors open at 6:30 PM - Admission is free to TAF members

Non-member admission is $2 at the door

======= Lots of software for sale =======
======= Lots of hardware for sale =======

Chris Krowchuk will be demonstrating the ultra-powerful
DirecT60 Hades computer!

The meeting site is located at Memorial Hall in the North York
City Center, 5110 Yonge St. at Parkhome Ave. Go to the lower level
(Concourse). Go to the far end of the complex, to the Library
Building. Memorial Hall is located beneath the Library. There are
signs pointing the way.

Visitors from out of town can take Highway 401 to the Yonge St.
exit. Travel north on Yonge St. for 5 stoplights and you're there!

Wednesday March 19th will be a great opportunity to upgrade some of
your favorite software: NVDI, MagiC, HDDriver, and dozens of other
titles. Tell Chris you're coming to the meeting and he'll bring
what you need . . .

=== for more info, contact: chris@compdirect.com ===
or lrhc@interlog.com

>and my college gives me access to the Unix account. I would say i am a

So what you are saying is that you have UNIX ``access''. What exactly is
that? Remote dial-up? At home you have Win95 on your desktop. That
can only be fairly compared with having UNIX on your desktop.

What sort of interface are you using? Motif? CDE? Or VT100 dial-up?
What applications are you running under Unix?

>major "dumb nut" when it comes to Unix.. i find it very complex,
>difficult to understand, and hated the interface.. I always wished
>that it would have a better interface, a little more friendly and
>would support multy programming in every terminal.. Not that Unix is
>not a multi programming OS, but.. like if only u can open up more than
>one file with VI and minimise the other one.

Umm, modern vi programs let you do that. I use a vi compatible program called
vim. It has a Motif or Athena graphical interface, multiple edit buffers and
full vi compatibility in all but one command. It does work with text terminals
too, of course. (Vim also supports Amiga, OS/2, 95 and NT and MS-DOS, it's not
just a UNIX thing).

>But, i throughly find Unix as a very very powerfull OS, i can do soo
>much things in it where in Windows could only wish for. If only i can
>understand more about the scrips, i could do loads of stuff..

Have you ever run conventional applications under Unix, such as
word-processors, or image manipulation programs? If all you use is a university
account, your view is probably a little slanted. Your access to the system will
be restricted, and the only software you are likely to be able to install on
the workstation is freeware. You probably don't even have sufficient access to
the University's facilities to be able to pop in and mount a CD-ROM.

This is one of the reasons why the biggest criticism of UNIX on usenet
seems to come from undergraduate freshmen, CS dropouts or people who

do Wintel tech support for a living: all they know of UNIX comes
from their experiences with a dial-up tty interface.

>While Windows is concern, i liked it when i can do other stuffs when
>waitting for one process to finish, the whole lot of tools i can
>purchase..and ofcourse.. GAMES. But the shit thing is.. when i get

Games? I used to play xpilots a great deal (a neat multi player graphical game
for UNIX systems with XWindow). The ID games Quake and Doom are developed
under UNIX. (Doom was originally developed on a NeXT, and Quake is done
using GNU tools, i.e. the GCC compiler).

I have played multi-player internet-based games under UNIX since 1989.
Imagine this: It's 1990 and you are playing a game of xtrek on a 1280x1024
19 inch display in a window that covers most of it. What sorts of games
were PC users playing at that time? Some single player bit-mapped crap in
320x200, or 16 color EGA, no doubt.

>some assignment.. lets say in VB , i would really wish that scripts
>would work in windows.. it's just whole lot more easier.. than to
>look through the On-line help.. which speaks in a language only the
>person wrote it would understand.
>
>I was told that Unix has a version with GUI . I can only dream of
>getting a first hand look at it.. since my country is always slow when
>it comes to IT.

Umm, you could just try installing Linux, which is freely distributed. Linux
levels the ground between the rich and the poor, and does not stop at
political, social or economical boundaries.

There is plenty of commercial software for it. I have even started
seeing some advertisements for a version of the common desktop environment
(CDE).

Students in North America have a view of UNIX that isn't much different from
yours. Unless they have installed it on their PC's or worked with it at work,
all the know is the text interface. That's because the OS is used to provide
low-cost efficient access to things like mail and news for thousands of
students. People who run UNIX (freeware or otherwise) on their desktops have a
totally different view.

[Let's try to trim these headers, shall we? Nobody in comp.security
wants to read this. I'm reading in comp.lang.c, unfortunately, so I'm
leaving that in.]

You're very right-its got to be the cross-post from Hell-I've seen it almost everywhere! As an Atari owner, I did respond to it earlier, though I don't know if it made it through all the "hype" <smile> I asked why we were seeing this in comp.sys.atari.advocacy, and that my Atari Falcons DSP-equipped audio system was on par (better!) than both other systems! :)

If you mean the old 8-bit stuff, check out http://www.emulators.com/ - home of the guys who wrote PC XFormer, the 8-bit Atari emulator. As well as selling XFormer cables to do the thing you want, they have plans available to build your own cable.

ATB, Frank.

Its all about defending your right to choose whatever computing platform you wish to use (in this case, Atari!), its about letting the uninformed masses of Bill Gates clone "wannabe's" know that we (still!) believe in the computer with the friendliest OS this side of Pluto/Neptune (has it moved back out into its reg. orbit yet?), its about drawing a line in the sand (our beliefs) and standing toe-to-toe with anyone who tries to cast doubt on said beliefs...We are the Star Wars "rebels" fighting against the Evil Empire (Microsloths aim at total monopoly) Its a lonely (but good!) fight, we fight every day, every time we flick a switch and TOS boots up...AND every time TOS is the OS that appears on a screen, thats another victory for us, the few, the free, the proud... :)

The ST isn't 8 bit either. He was referring to the "old" Atari 800
(XE/XM/whatever) series of 8 bit computers.
But you are right, the ST isn't old. 12 years is nothing compared to the
time UNIX (not actually a system but an OS) has been around. And what to
think about PC's... They've been around for 17 years.

She has a point, of sorts - do a forever loop inside a windoze 16 prog
even running on 95 - but just how do you get rid of that or worse a
for(;;)fork(); ? I've been doing AIX for a while and still don't
have an answer. On big iren, I'd get a phone call in about 30 seconds
take another 30 to find and kill the prog, another 30 to look up the
ID and kill the owner; problem solved, no IPL, no fuss, just a minute
or two of aggravation - not a system lockup and reboot. On aix the
system keeps running and users still get work done just slowly. But
I can't kill the damned thing.

How?? (In linux too, I anticipate doing some progery and might do
it by accident).

>it by accident).

In Linux, like in other modern UNIXes, you have the idea of process limits. If you are on a Linux system, type ``help ulimit'' in the bash shell.

You can restrict the number of processes that a user can have, and also restrict the sizes of various key memory regions (code, data, stack) of the children of any process, and also the maximum running time, and other limits. The easiest way to enforce limits for all users is to deposit a suitable ``ulimit'' command line in the scripts that get executed when they log in. Also, pay attention to the difference between soft and hard limits. Hard limits can never be raised, but soft limits can be lowered and raised.

Incidentally, I recently read of a report that Windows NT allows a process to change its own priority and thus seize the processor. A patch was sent out for it, but this wonderfully undergraduate mistake gave me a few chuckles!

Hey Eric...

Good to hear from you again, and I really hate to inform you of this, but
the ST is not an 8-bit machine!

I have, however, gotton that ol' 800 working well with the disks and
everything... so I'm looking to move some basic-type stuff onto the
floppies for that as well.

My question is this: Does an ST have an SIO interface to hook up 8-bit
peripherals? I'm getting an (Not old - middleaged) 1040ST in May.

Cya l8r,
"Merch"

No, but there was a custom cable designed for use with Darek Mihocka's
8-bit emulator on the ST. I can't remember Darek's e-mail address, but
his company (which markets 8-bit and ST emulators for the Windoze) is
called Branch Always Software (BRA-Soft) and is on the web... perhaps he
still sells these cables?

Actually, he's changed the URL to

www.emulators.com

and the company is now known as

Emulators Online

His company is now called Emulators Inc. I wonder if Darek works for
MS, he is in the same neighborhood.

He was hired by Microsoft right out of college years ago, and he was
still working for them when I met him about 18 months ago. So he's
probably still there.

Thanks, I knew about ulimit (on AIX, haven't yet put up linux). The
problem is, its not good enough. In AIX the hard lower limit is 40
(Yes I've screamed at IBM). Likelwise minima for stack and heap
sizes still let it run. And of course by no matter how fast I kill
one process new ones are created before they're all extinguished.
(yes I've refined it to a single pipeline'd command to try and get
them all in one swat). May be big iron prejudice on my part, but
this is ridiculous - a single non privilidged user should *NEVER*
be able take up that much of the machine and/or be unstoppable.
Just asking. In many ways I've come to consider unix superior
even to the mainframe OS's for program development. As indicated I
intend to put it on my PC at home -way better than MS! But from the
mainframe world, this "feature" just seems intolerable in a
multi(real)user system.
Unix needs a faultless way to limit or kill process by
uid/gid/load-module name and about any other categorization. I don't
know if this is mere oversight or (as I suspect) a "flaw"/"feature" of
the unix program paradigm. (translation: I'm a relative newbie to
*ix, not a seasoned prog'r - in unix).
Constructive thoughts very welcome. Thanks again.

It's amazing how quickly you get used to the power of UNIX/X
systems. Until someone pointed it out to me I thought nothing of
overcoming the lack of an Emacs on one set of computers (physics) by
logging into another (CS or AI) and executing Emacs there. I expected
to be able to execute programs on remote computers and have them come
up in a window on my desktop the same as local ones.

Kaz> There is plenty of commercial software for it. I have even

Caldera (http://www.caldera.com/) is the Linux CDE.

]
] Thanks, I knew about ulimit (on AIX, haven't yet put up linux). The
] problem is, its not good enough. In AIX the hard lower limit is 40
] (Yes I've screamed at IBM).

A user can't be limited to less than that many processes?
Regardless, that shouldn't be a problem; it will only take a
fraction of a second for those 40 slots to fill up.

] And of course by no matter how fast I kill one process new ones
] are created before they're all extinguished. (yes I've refined
] it to a single pipeline'd command to try and get them all in
] one swat).

Work smarter, not harder.

Use SIGSTOP to stop all the processes, and then kill them. If
they are not all killed at the same time who cares .. the rest
cannot fork since they are stopped.

] May be big iron prejudice on my part, but this is ridiculous -
] a single non privilidged user should *NEVER* be able take up
] that much of the machine and/or be unstoppable.

a non-priviledged user .. isn't that a contradiction?

I'm working on an event simulator, why should I *NEVER* be
able to take up 100% cpu time? Or I'm writing a parallel program
using PVM (parallel virtual machine) library, why should I not be
allowed to have 40 processes working away?

] Just asking. In many ways I've come to consider unix superior
] even to the mainframe OS's for program development. As indicated I
] intend to put it on my PC at home -way better than MS! But from the
] mainframe world, this "feature" just seems intolerable in a
] multi(real)user system.

Well now you can have an even better opinion of unix, since you
know how to kill the runaway processes now.

] Unix needs a faultless way to limit or kill process by
] uid/gid/load-module name and about any other categorization.

Use ps & shell script. Send SIGSTOP first, then SIGKILL if
you have some kind of fork problem.

Like I have a shell-function 'tkill' that takes text as a
paramter and kills processes with that text in the output from
'ps awx'.

] I don't know if this is mere oversight or (as I suspect) a
] "flaw"/"feature" of the unix program paradigm. (translation:
] I'm a relative newbie to *ix, not a seasoned prog'r - in unix).

It you can write a shell script to do it, isn't that good enough?

] Constructive thoughts very welcome. Thanks again.

Thanks! This is exactly the solution I needed for this kind
of problem. fwiw, even the IBM people in Texas - at least
those in cussing support - never even came close, but this
ought to work. My only remaining question is why this isn't
plastered everywhere - several books I've read mention the
for(;;)fork() problem, but this is the first I've seen of a
viable solution (or maybe I just missed some broad hints -
I said I was a relative newbie. Thanks again!).

most Linux distributions call it killall(1). beware: Solaris has a
very different beast by the same name. the Linux implementation lets
you, for example, kill all processes with a certain name, or belonging
to a certain UID. the Solaris one kills _all_ processes, full stop.

| \/ | ( | ` | | ) | |
| | -+_ *** +-- +-- +-- +--
| | | ) | | \ | |
| | `-+- | | \ +--- +--- BANNER CONTEST
```

Hi,

Would you like to promote a Microsoft-Free world?
Are you proud of running your web site free of Microsoft stuff?
Ever wished you could win prizes just drawing a nice banner?

Here's your chance to do all three at once - enter the Petitmou Banner Contest!

The winner's banner will be provided for free to the Internet community so anyone can put it on his page. Hopefully, this banner will show up on lots of pages and the web will start wearing a uniform Microsoft-Free logo.

Do not hesitate anymore, and start drawing your banner.

* Click here: http://www.petitmou.com/contest.html *

==========

The idea we had about the contest is to define ONE unique microsoft-free banner (which could be yours if you win the contest). Just like Netscape and, microsoft has their banner (which appears everywhere), we think we could benefit in a unique microsoft-free banner. With a unique banner showing up in many places, we have a better chance to impact the web surfers. Promoting an idea is better served when you have a recognizable logo.

That's why we think we think you should join us, put a link to the contest page (as described in my previous mail) and draw your banner or badge for the contest.

==========

To promote the contest, *** add this text in your homepage *** :

Participate to the Microsoft-Free Banner Contest

==========

Forward this mail to every friend who could be interested by
the contest or by visiting another Unofficial Microsoft site.
* Visit http://www.petitmou.com/contest.html *

==========

Oh my God! And all this time I've been thinking that programs that use the modem might need to configure it, with commands like "ATE0V1Q0&B0...", and which Microsoft Windows 95 does a pretty good job of detecting automatically, even on pre-PNP modems.

(BTW, I run Linux 99% of the time, but the fact is that MS has done some good things in W95, and autodetecting modem init strings is one of them.)

:>them.)

YMMV,, Win 95 detected both my modems, and i was reasonably impressed,
BUT it got them BOTH WRONG. (G). I stopped being impressed at this
point, because the fact that both of them existed in the database of
modems, yet win 95 still got them wrong was pretty pathetic. If something
is offerring to make a decision for me, I'd expect at LEAST a 50% success
rate, after all, I have the ability for a 50% success rate on any
decision. (i.e. right or wrong). So, 0 and 2 didn't particularly instill
confidence in me.

Weeeellllll.... my gateway comes with a gateway telepath modem, which
really is just a USR sportster 33.6. So I don't exactly freak out when
it doesn't recognize the USR as a gateway, despite the fact that gateway
is in the database.

Have you seen the person formerly known as Sinclap, who spouted out about audio production on the Mac vs. Falcon without actually knowing any facts? His argument was simply destroyed in this newsgroup.

Of course, he NEVER RESPONDED. I would be happy to repost if he would be interested in responding.. but in order to do so, he would have to confess his lack of knowledge, something it seems he is unlikely to do.

Now this post was just a test too.. :)

666. GateWay2000 Makes Bid for Amiga Tech.

Newsgroup: comp.sys.atari.advocacy
Date: 1997-03-30 00:00:00 UTC
From: bsrowe00@sac.uky.edu
Message-ID: <5hkog4$l7c@service3.uky.edu>
Source record: 6363

The wires and IRC are buzzing today with the news that GateWay 2000, the successful PC maker with the cow-colored boxes, has put in a successful bid for Amiga Technologies. Their press release has appeared on yahoo, and is now on the main entry page at Amiga Tech's own site at www.amiga.de.

The press release reports that Hembach, the German court-appointed Administrator of the sale of Amiga Tech, has accepted G2000's bid and that it is now subject to "regulatory approval."

For those of you not familiar with Gateway 2000, they are located in South Dakota, USA, and run a lot of tv advertising here, often whimsical, with an attitude, playing off their fondness for black and white "cow colored" graphics.

Good news for the Amiga faithful is that their press release says:
>"This acquisition is good news for Gateway and customers of AMIGA," said Rick
>Snyder, president and COO of Gateway 2000. "It will strengthen our
>intellectual property position and invigorate a company that has been a
>pioneer in multimedia solutions and operating systems technology."

Gateway 2000 has 9700 employees, and grossed $5 billion last year.

What this portends for us is manyfold - a well-respected hot selling computer company making Amigas could easily attract back the big-name software houses.

Things are finally looking up :)

I wonder if people who comment of the Newton's hand writting recognition
accuracy have used one for any length of time. People do realise that it
uses a neural network to learn how to recognize an individual's writting
and you probably have to use it a week to fully train it, right?

Which one did you buy? And you know, I bet that we could form a company that develops software that looks at people's sigs and decides what changes need to be made to their email address valid. We could sell it to those internet marketing companies and make a million bucks.

>What do you mean by that? The IBM PC was open? Was it possible to install any
>kind of hardware and software? Motorola processors, Amiga Operating system, etc?

Yes, it was. The PC was open because IBM used off the shelf parts. The biggest being the Intel 8088, which anyone could buy. Compared to, say, an S/36, the PC was about as open as you can get. And I *have* had a Motorola 68000 in a PC, back in 1982, in an add-on card.

>Probably not, the IBM PC was a closed solution, which became a de-facto
>standard. IEEE gave it the rest, so now every idiot is able to produce pieces

>two/three years ago.

Yes, capacities still increase. But tell me, if you don't consider the PC to be open, what *DO* you consider to be an open machine? The Mac? The Amiga? The NeXT?

>The PS/2 is not dead, because it was closed, but because of the bad maketing of
>IBM (same as OS/2). If Bill Gates would have taken care of the PS/2, then
>believe me most people would use microchannel architecture PC's.

What did Gates have to do with the PS/2? The MCA did not succeed not because of software (OS/2 ran just fine on it, in fact the ABIOS on the PS/2's helped it quite a bit), it died because of outrageous hardware. Try to buy a sound blaster, a modem, or even memory for an MCA box and you were looking at anywhere from a 50% to 100% increase over the ISA version.

>And which owns the bigger market share? DOS/Windows you find EVERYWHERE, for
>UNIX you need to go into an academic environment or some highly IT-specialized
>companies doing highly IT specialized stuff.

Not surprising, that's what it was designed for. Unix was not written for home consumers; Windows was. Likewise, Windows is not suited for the industrial strength applications that Unix revels in.

Win95 detected my internal modem. It got it right. It had previously
detected the SB16 PnP and the plug and play installation was exemplary.

Then it detected a new 3COM PCI NIC. It detected it alright, then
proceeded to give it the *same* IRQ settings as the internal modem. A
few hours later, I gave up in frustration and just overrode all the
settings and installed the card manually.

Rgds,

Chris

It certainly DID get better but never got any faster or particularly
accurate. IF you print then it's recognition is quite impressive,
cursive is OK at best.

I never stated the Mac did audio better or worse. I stated that the Falcon does it better for the same amount of money.

> No lack of knowlege here. Just the market facts..

If you had the market facts, you would not have posted the drivel below. Please see the post I made in response to you, that you never had the courtesy to respond to. I will assume you were having some kind of 'ISP problems' (heh, heh) and didn't have the chance to see it the last time around.

PETER SINCLAIR-DAY wrote:

Don't be such an idiot. I work on Macs daily, including said 6400.

On the other hand, just how much experience do you have with the Falcon? Have you ever edited digital audio on one?

Also, I'm talking about OVERALL audio performance, not just processor speed.

> The Falcons are stuck with antiquated 030 processor that needs a DSP.. All
> this audio inputs and outputs can be added to the 6400 and still be cheaper..

See, you have NO CLUE what the FUCK you are talking about. I am a Professional audio editor and musician with over a decade of experience in digital audio. You know nothing about the subject. Pro Tools Project is the least expensive currently available Mac system that offers 8 outputs and 8 inputs. It is around $2,500, NOT including the computer. The Korg card, which offers only 2 inputs and 2 outputs (but

is expandeable to 8 inputs and 8 outputs for another $1500) is $1200
itself. That's all there is out there, moron. I will assume you have
spent a little time in math class, so I'll let you do the math yourself.

> Source please.. The reason the 6400 does not have a dsp is due to the risc
> PowerPC.

Which I alluded to, but you cannot use effects that were written for a
DSP chip (like all DIGIDESIGN effects) on the PPC without a Digidesign
card. Yes, some are being re-written, but they haven't been yet.

> And you have evidense that the Falcon has better timing? What if the musician
> wants to do other tasks besides midi like web page creation, and having the best
> internt tools?

Yes, I do. There have been a couple of articles written in european
music magazines that deal with this question. Try searching the
archives of Sound On Sound if you really want to know.. and I trust you
don't.

Also, because of the way the Mac handles digital audio via its inputs,
there is a slight audio delay when recording new audio while listening
to previously recorded audio, especially when VST's real time effects
are used. It's not a huge delay, but it's something to be aware about..
if you're recording timing critical audio, it might interfere with your
groove.

Nice try attempting to change the subject. The issue is AUDIO tools,
not WEB tools or word processing.

> > I will say I've had far more crashes on my Pro Tools III system
> > at work then on my Falcon at home..
>
> PowerTools III system? Must be a Mac clone firm. I would check with your
> extensions to make sure none are conflicting. That should solve your crashing
> issue..

Now, you've demonstrated your complete IGNORANCE of the audio world.
Pro Tools III is a Mac based digital editing system.. THE MOST COMMON
ONE IN THE WORLD. If you don't know what THAT is, then just shut up
about audio on the Mac. You're clearly talking out of your ass.

> Heck I can get new refurbished PowerMac Performas 6116 for $599 with a 90 day
> Apple warranty. Price includes keyboard and CDROM(option and extra cost for
> Falcon).

Sure.. you could. But the same audio input/output issues apply. If
you're buying it for audio, who gives a damn about CD-ROM?

> The Midi market has standarized on Mac/PC. I hardly see any mention of the
> Falcon as a midi station.

And you've already demonstrated your ignorance of the market by not even
knowing what a Pro Tools system is. Truthfully though, the Falcon is

not very popular compared to Mac/PC. But I'm not buying a computer
based on a popularity contest, it's how well the computer does what I
want it to do. It does, for less money.

> I bet that Cubase Audio VST/Mac system out sells a Cubase Falcon one. So your
> asertion is that Falcon will remain viable due to cheaper expansion options?
> Do you have proof?

Yes, Cubase Audio VST clearly outsells a Cubase Falcon.. it seems like a
system with excellent potential. I'm making music NOW, not waiting for
potential.

It eventually will be a better bargain then a Falcon. I don't know
whether the Falcon will remain viable or not.. I just know it IS now, I
can
create without limits right now. That's all I need to know.

I already gave you proof, I gave you model numbers and prices. You gave
me a bunch of hot air and demonstrations of your ignorance.

You already have a Mac, you know little about the Falcon, and even LESS
about digital audio production. Tell you what.. I won't speak out as an
expert the Mac computer if you won't speak out on ANYTHING that has
ANYTHING to do with digital audio production ON ANY FUCKING PLATFORM.

Yes.

Just like "muscle" cars, computers can get you respect and admiration from your peers.

And this especially applies if you suffer from LDS (LittleDickSyndrome).

Many of us can probably name one correspondent in comp.sys.atari.* that probably falls into this category, who has just come back to us after a hiatus.

Won't work. A process can't fork if it's dead, either, which is
exactly what it'll be if it receives a SIGKILL.

No, the real problem is that the processes are continuing to fork new
processes as you're in the process of generating the process list, so
your process list isn't likely to be comprehensive.

What you *can* do, though, is send the signal to the process group.
You specify a negative pid to do that. For it to work, though, I
believe you'll have to figure out the process group ID associated with
the processes and kill that. 'ps -j' will do that for you under
Linux.

Naturally, that doesn't help if the new processes being creating each
set themselves up in their own process group.

To: rhofmann@crl.com

I just bought a Falcon. It's a great machine. You don't have to worry
about the OS falling apart. With Windoze 95.....*sigh*

But I'm outnumbered. All my classmates have PC....me too, but they pick
on anything that isn't PC or Tinysoft. MAC....well it's a capable
computer, It's better than the BC....uhh, sorry PC. But I have had the
worst possible software failure on the BC. When i tried to access a CD,
Windoze crashed. When I play games, I run out of memory (16Mb).
I NEVER HAD THAT SHIT WITH ATARI!!!!

Atari is like a Phoenix. It may die, but is always reborn.

683. Fork bombs, the final analysis. (was Re: Who makes more $$...)

]
] Won't work. A process can't fork if it's dead, either, which
] is exactly what it'll be if it receives a SIGKILL.

.. but what's left of the other processes *can* fork.

This answer was in the context of a 'for(;;)fork();' loop -- a condition where processes never exit. Most unix now can limit a user to a fixed number of processes, say 40 are free.

The fork() bomb quickly fills in these 40 slots. Each of the 40 processes continually calls fork() and receives EAGAIN *without* creating any new processes.

At this point the process IDs are stable; no new processes are being created/destroyed. If you kill any of them, the unkilled ones will quickly fork() more to fill up the 40 slots. You can't kill all of them at once since kill() only sends signals to 1 process at a time.

But if you *SIGSTOP* them then they all still exists as processes, so there are no new slots for not-yet-stopped processes to fork into. *All* the processes will be stopped, even though stopping them all isn't an atomic operation.

Then if you kill any of them there are slots to fork() into, but all the fork-bomb processes are stopped (SIGSTOP cannot be caught or ignored).

] No, the real problem is that the processes are continuing to
] fork new processes as you're in the process of generating the

] process list, so your process list isn't likely to be
] comprehensive.

Not in the example Terrence gave, but it can be the real problem.
Take this diabolical fork-bomb that I just now thought up:

```
main() {
for(; random()%3; ) {
if (0==fork()) srandom(getpid());
setpgrp();
}
}
```

Ouch, that hurts! The random part says with 0,1,2 fork on 1,2 and
exit on 0. So, on average it'll fork 2 children and exit. So we
have it growing processes .. *but* when it hits the 'wall' the
current processes will die, leaving space for others to fork
into. This way there are no constant PIDs that you can use in
order to send SIGSTOP to. However, by repeating the 'stop' part
of 'stop then kill' until by luck you get them all might work.

(we need to seed the random generator, since otherwise all
processes would use the same sequence, so when it got to a 0 all
of them would decide to exit)

And of course, the mother of all fork-bombs has the parent exit
after a while, like above. But before it does it calls wait3()
to find any children in a stopped state, so it can restart them
(or better yet kill them, since their PID is already known).

If you are root, you can set a CPU-eating process or two at a
high priotiry and then at the next higher priority use the stop
and kill method and it'll probably work better...

The stop & kill should work perfectly with all *honest mistake*
fork-bombs. If one of the above is used, the final solution is
to kick the bum off the system (and get the company lawyers to
harass him) ;-)

] What you *can* do, though, is send the signal to the process
] group. You specify a negative pid to do that. For it to work,
] though, I believe you'll have to figure out the process group
] ID associated with the processes and kill that. 'ps -j' will
] do that for you under Linux.

Sounds like that will usually work, but only:

] Naturally, that doesn't help if the new processes being
] creating each set themselves up in their own process group.

Right, it is not going to work every time.

684. TOS Computing on a PowerMacintosh

Newsgroup: comp.sys.atari.advocacy
Date: 1997-04-04 00:00:00 UTC
From: Brian-Roland Miller <brmiller@tiac.net>
Message-ID: <33458441.1634@tiac.net>
Source record: 6381

With the new, 300-MHz entry-level systems from Apple coming out the door, a PowerMac with MagicMac is probably the best way to take TOS into the 90s!

Why, oh why, can't some small, daring company buy the rights to TOS, grab a CHRP board, license 68K emulation from Apple, throw a bunch of generic sound and graphics chips on the CHRP board, add in a PPC-native TOS, and sell it as a low-resource computer? It would be a fantastic value! It would also offer the security of being able to run MacOS 8, 9, and later, X.

I see Mr. Sinclap has returned to accurse the TOS groups with yet more "expansive Hades" stuff. <sigh>

Yes, but won't a killed process free up a space, so to speak, in the limit
of 40 processes mentioned above; thus allowing the creation of a new,
active process in the killed one's place. Thus 40 processes can be stopped,
hence no more forks ever. They can now be killed at your leisure.

Is that right?

What you probably saw was AmigaOS 1.3 on an A500, and the AmigaOS has
seriously upgraded since that.

Fact is, that the current version of AmigaOs(v3.1) is much faster,better
and more reliable than the current version of MacOS(7.6).

And this is in spite the fact that it haven't been seriously developed
since Commodore went bankrupt in '94(nobody was talking about the AmigaOS
being fo sale in '89).

Can you for instance preempively multitask on your current Powermac?

Do you have a shell?

Fine..If the Falcon meets the needs for audio production, great.
However, performance on the other platforms are increasing
rapidly and
prices are dropping. Espicially the Powermac 6500 line..

> > And you have benchmarked this? Whats your deffinition of near 6400
> > performance? Do you know what a 6400 is?
>
Yep..The 6400 is part of the defunct Performa line and has been
renamed
the PowerMacintosh. Processor speed ranges from 180mhz all the
way up
to 300mhz(!) for the 6500 line.

> Don't be such an idiot. I work on Macs daily, including said 6400.

True.. People should buy what ever they think is best.. But
the
Falcon technology needs to be upgraded and the pricing should
reflect
the state of technology. The Falcon has been stereotyped as
just a
midi box. Imagine what would of happened if a million were
sold..
Falcon users would of have not complained about the sorry state
of
internet and web tools..

True.. The new Virtual PC by Connectix will alow PowerMacs from
the
lowly 601 series to run Wintel 3, 95, Dos, OS2 and NextStep at
higher performance than SoftWindows.

>

I wasn;t much of a speller. Atari users do need hardware relief
because the current TOS boxes need a mortgage to fund one.
Atari
Tos users are in the same boat as Mac users were in the 80's..
You
needed a loan to fund a Mac..

How do we know that it was intended to be spelled this way? Is there
any evidence that UNIX was actually spelled this way?

>later, "Unix") was a pun on Multics which was one of Unix predecessors.

Multics can hardly be called a Unix predecessor, except in the vague
chronological sense. It took about a decade for UNIX to acquire some
of the sophisticated memory-mapping features of Multics. In Multics,
every system object (such as a file) is a memory mapped region. Not
bad for 1960's. Ken Thompson did work on the Multics project---that is
the real connection between Multics and UNIX. Demand paged virtual memory
first appeared in BSD 4.2 (?), and I believe it was SunOS that introduced
shared libraries.

>Multics stood for "MULTiplexed Information and Computer System"
>(watch for those capitals). "UNIX" stands for "UNiplexed Information
>and Computer System". My references: FAQ for comp.unix.shell and a

Is that so? I don't see an X anywhere in the expanded phrase. UNIX is a pun on
an acronym. A pun on an acronym need not itself be an acronym.

BTW the FAQ for comp.unix.shell is chock full of carelessly written
shell programming examples, so why trust its assertions about computing
history?

For example, in question 2.6 of the FAQ (How do I rename "*.foo" to "*.bar"...)
we have:

Korn Shell:

```
for f in *.foo; do
mv $f ${f%foo}bar
done
```

This script will do funny things if the the '*.foo' pattern
matches filenames containing spaces, meta-characters or names that look
like command line options. Hence it fails to have general validity.
A better version is:

```
for f in *.foo; do
mv -- "$f" "${f%foo}%bar"
done
```

The quotes prevent the splitting of the expanded text into multiple words,
and prevent the text from undergoing pathname expansion. The -- ensures
that none of the filenames are misinterpreted as an option to the mv command.

> higher performance than SoftWindows.

As long as 680x0 code has to be run in emulation mode on the
PPC, there is little benifit for MagiC Mac users to purchase
a 300MHz PM. As far as I can tell, a 50MHz 040 executes 68000
code just as fast as ANY PM. Actually, I shouldn't say as far
as I can tell, it is a fact. Windows and other X86 code isn't
an issue here. Why not just purchase an inexpensive Pentium
200 to run the apps?

Another short blurb, unrelated, but I just read a VERY short
review of Light Wave 3D for the Mac in this months Mac World
(or Mac User, their about the same). I found it funny that the
premeier 3D animation/rendering application for the NT/W95/Amiga/
SGI market was only given about 1/8 of a page for a review.
The way the article was written, it lead me to believe the guy
finds it to much trouble to tie his shoes in the morning unless
he can do it by clicking from the desktop.
What I don't find funny is these are the same people "telling"
the public which PM clone is the best and how great the "next"
version of the Mac O/S will be.

What applications would these be? Define wonderful? With the
introduction
of Newsie, I have elimated all but Netscape from my internet needs on a
platform
other than my TOS machines. I haven't had much time for surfing lately,
but you
should really see CAB in action at 1024*768 24bit color on my Falcon
with my
new Nova card.

Funny, I just picked up a Falcon for $150.00. Works fine for me
and my bank account. And with the 040 installed, it will run just
as fast as the 300MHz Macs do for my needs, under TOS.

Hello folks,

Could somebody help me getting joysticks for my ST computer?
I'm not talkng about the crappy ones, but the good old joysticks like
Kraft-joysticks.

E-mail me privately if you can.
Thanks.

The Hidden a.k.a Sebi

Again, the issues are: Price, productivity, and numbers of outputs and inputs vs. price.

> > On the other hand, just how much experience do you have with the
> > Falcon? Have you ever edited digital audio on one?
>
> No, I can't say so..

I don't understand how you can even comment about something you admittedly know nothing about. Why?

> The new 6500 just blows away the Falcon..

I'm sure it does. But how much does it cost? For $300 used, you can have a Falcon and be working immediately with audio (and SCSI hard drive). For $400, you can add 8 balanced analog outputs at pro line level. For another $400, add eight inputs (balanced line level).

A used Power PC, say 7200 or something, costs, what, $1000 used? To add eight additional outputs, there are a couple of options. There's a new board from Emagic that costs around $600 that will give you eight outputs, but it's on RCA jacks, unbalanced, not at professional line level. You could buy a Korg 1212 (when it's released) for around $1000 and then buy their 8 output box for $500 that will get you eight balanced line level outputs, but that's still a lot more expensive. A used Pro Tools Project board and software setup will set you back about $1500 or so, but at least that also gives you eight inputs as well. An Audiomedia III card will give you 4 outputs, for around $500 (RCA unbalanced not pro level).

As I've said before, I'm sure at some point the PPC will be a less expensive solution for HD recording with multiple pro outputs. It isn't now, that's all there is to it!

> I am sure you are getting ripped at these prices.. And I know
> there are cheaper solutions..

You don't "KNOW." Otherwise you would have posted something concrete and proven me wrong. I invite you to ask everyone you know if there is

a cheaper solution.. hell, call recording studios, music stores, etc,
and ask them.

> Nice try to..The internet changes everything. Audio
> minipulation on
> the internet is here and the Falcon has not kept up. Even
> Falcon
> owners are pissed because they can't find decent internet
> tools..

That may be. I don't use the Falcon to access the internet, I have a
cheap 486 for that. The Falcon is just as suitable for creating raw
material for the internet as any other platform. Now, the Shockwave
encoder and other internet tools are not available on the Falcon, but
that has nothing to do with music and audio PRODUCTION.

> True.. People should buy what ever they think is best.. But
> the Falcon technology needs to be upgraded and the pricing should
> reflect the state of technology.

It does. That's why you can buy a Falcon for $300 used. That's what
the market has to say.

> The Falcon has been stereotyped as
> just a midi box. Imagine what would of happened if a million were
> sold.. Falcon users would of have not complained about the sorry state
> of internet and web tools..

Again, that's not what we're talking about. I am talking about, once
again, the Falcon's viability as a cost effective hard disk
recorder/MIDI/audio production solution. You have said absolutely
nothing to refute my points. You actually don't know enough about the
audio/music production market to do so anyway, so the point is moot.

> I know that Falcon users are dumping their midi systems for all
> Mac base one..

No, you read that ONE Falcon user is dumping his for a Mac. Actually, I
know a few others who have done the same thing. If you subscribe to the
Cubase Users Mailing List, you'll meet others who have dumped their
Falcon or ST for a Mac or PC. All have had problems of one type or
another that have impacted their productivity. Yes, they eventually get
them running, but most Mac users have complained about the delay from
audio input to audio output when using the stock audio inputs and
outputs, and the quality of the audio ins and outs. The delay doesn't
exist on the Falcon, because it's designed for audio. Apple has come
out and admitted that the audio market wasn't a significant enough
market for them to work with.. and it shows in their product. Their
stock inputs and outputs are worse then PC sound cards costing $100 and
up.

Creative people don't need to have the latest and greatest to create
great work. That's why many painters still use a paintbrush, many

writers still use a manual typewriter, and many songwriters just use an acoustic guitar.. and that's why I use a Falcon.

Today, there is no more cost effective, reliable, and better integrated audio/MIDI solution then Cubase Audio on the Falcon. Yes, there are BETTER solutions, but they cost much more.

-Mark

Web TV gives him a huge pipeline from MSN to users.

Gates will likely "hardwire" the web TV backchannel to MSN, with the
the satellite as the forward channel.

This gives him a large pipe directly to users.

It's a very smart move.

Almost true, Apple sued Digital Research (Which created GEM) and DR
had to modify GEM a bit: They had to remove the trashcan and do
something with the window-gadgets. Atari got away with the "original"
GEM though, which is why Atari-GEM is superior to PC-GEM.

This may be true now, but I'll bet that Gates reengineers the
satellite feed and adds an "output to computer" port on the
set-top box. Instead of being constrained to the web TV's
box, the subscriber will be able to use their home PC.

This will give Gates a large forward channel, with all subscribers
back-channeling through MSN.

At $50/month, and 1 million subscribers, Gates gets back $600
million/year. Would 1 million people sign up? Probably..

I don't think it was any more stable than 7.6, I've not had 7.6 for long
but even with all the extensions I've got loaded I've not had it crash
yet, YMMV. If you are taling about efficiency when you mean faster then
I'd have to agree. What is "Better"?

> Can you for instance preempively multitask on your current Powermac?

Yep but not under MacOS :(

The Amiga's hey-day if I remember correctly. AmigaDos 1.3 had a great
shell, Arexx (remember the press ravings when OS/2 finally got rexx
years later ?) and a groovy rebootable ramdrive. As it stands, except
for the GUI and certain additions to try and keep it relevant with
current day "buzz words", there has been little architectural change.

> >

Come on, you can't be serious. I was nice, but was showing the effects
of less-than brilliant planning during development. Also, considering
the main-stream machine, the godsend after 10000years of 8Mhz 68000, was
only a 16Mhz 68020 (the A4000 was too expensive, not to mention only
ever in stock sporadicaly), I dont think "faster, better (some things
were certainly "groovier") but fairly reliable (it would be unrealistic
to say "quality" was a hallmark of C=). Anyway, its all irrelevant the
MacOs version numbers are larger, so it must be better.

And lastly, I feel so guilty for briging up this last point.... but...
dont you remember the serial ports! You have to admit they were a joke.
A don't try and mention the multi-port serial boards... I and a friend
ran an Amiga BBS and we never got the damned thing to work properly.

>
> I don't think it was any more stable than 7.6, I've not had 7.6 for long

Testify! Testify!

Doesn't the doctrine ever change ? I was saying this as an Amiga
en-feavored teenage saleman in a computer shop. I seem the remember the
current day competition was the Apple IIGS (Nostalgic but not exciting),
Atari St (Im sure there GUI was invented by the people who created
Teletext) or Messy Dos (nothing need be said). Lets keep things in
perspective though.

So my final question
is.....
.....
.....with some believers still turning up to Amiga Church on
Sunday... Do you think were witnessing the birth of a new religion which
will rival Christianity in 1000 years ? ..... Hmmmm...

Regards and evasive techniques in advance,

Daniel Soderstrom.

: Daniel Soderstrom.

I remember back in 86, 87 and 88 running a 500 under 1.3 in a stable manner. But everytime I'd go to a store to check out the machines, salesmen were crashing them left and right. They knew nothing about multitasking, priorities etc.

It sometimes seemed to me that they *wanted* the machine to crash. That's not true of course, but it happened every time.

I believe the reason was mainly bravado. Most of the salesfolks were quite ignorant of either the Amiga, multitasking, or computers in general, yet they valliantly clicked away like pros, in turbo mode - in order to dispell any inkling that they were in actual fact, lamers. Blame it on the machine, blame it on the software - these digital supermen would blast their way blissfully into guruland without fail.

Meanwhile, many of us ran 1.3 with few glitches once we'd balanced our systems to our specs. Testing new public domain software would, yes, crash the machine more often than we'd like, and that *could* be squarely blamed on either the software itself, or clashes with installed software which was not quite up to snuff.

But there was *no* excuse for allowing a suite of installed programs, on show at a store, to crash as a matter of course. It demonstrated a lack of ability, knowledge, and interest in the machine and its OS.

There must have been exceptions, but I never saw them, except for once or twice at a large computer show, where often they *did* know what they were doing. It seems many stores got salesmen where they could get them, while show booths had literates onboard.

As for the 'look' of 1.3 one could make it quite acceptable to practically any taste. There were slews of esthetic addons and beautifiers around, most of them in the public domain. No two worksessions looked alike in *my* neighborhood. I think the argument that the Amiga OS looked 'ugly' is not valid.

The main drawback was interlace flicker. This, with a simple add-on could be overcome. Considering the multitude of add-ons the msdog machine of the mid-80's needed, I don't think it was unreasonable to guage a machine *with* basic add-ons onboard, like the flicker-fixer for the Amiga. Nex

So did I when I read about on comp.risks, especially as the posting date was close to April 1, maybe it is a joke. If not it bl...y well ought to be.

OK maybe they haven't gone through with the deal yet, but the intention is there I am sure. If you can't beat it, buy it and bury it would apply nicely to BGs philosophy of world domination, where Unix and Java are concerned.

Below I include a quote from the source which was:

RISKS-LIST: Risks-Forum Digest Tuesday 1 April 1997 Volume 19 : Issue 01

beginning of posting is:

Date: Mon, 31 Mar 1997 17:04:01 -0800
From: mas@acm.org (Mark Stalzer)
Subject: Microsoft buys Sun

This item may be of some interest to RISKS readers, given all of the discussions about ActiveX and Java. -- Mark

---

Redmond WA, March 31 (Routers) - Microsoft Corporation announced after the close today that it will buy Sun Microsystems in a deal valued at $11.7 billion. The price works out to $50 a share, which is a premium over Sun's

close at $34. Microsoft will finance the deal by issuing 50 million shares of common stock, using some of its cash reserves, and borrowing $5 billion at "very low rates" from a "long time strategic partner" rumored to be Intel Corporation. Every 4 shares of Sun stock will be exchanged for 1 share of newly issued Microsoft stock plus approximately $100 in cash.

Bill Gates, Microsoft's Chairman said "It's time to kill Unix. Unix is providing stiff competition to Windows NT in the server arena. We have already placed NT on Digital and HP servers, and Sun was the only substantial holdout. So we decided just to purchase Sun to assure that their servers ship with NT." He continued, "We also wanted control over Java to better position ourselves to, uh, compete with Netscape."Redmond WA, March 31 (Routers) - Microsoft Corporation announced after the close today that it will buy Sun Microsystems in a deal valued at $11.7 billion. The price works out to $50 a share, which is a premium over Sun's close at $34. Microsoft will finance the deal by issuing 50 million shares of common stock, using some of its cash reserves, and borrowing $5 billion at "very low rates" from a "long time strategic partner" rumored to be Intel Corporation. He continued, "We also wanted control over Java to better position ourselves to, uh, compete with Netscape."

<snip>

A spokesperson for the Department of Justice said there was no official comment on the proposed transaction. Although, a highly placed Justice source felt that there shouldn't be any problems because "Microsoft is a software company and Sun is a hardware company."

<snip>

I consider that many would take issue with the statement that implies Sun is a hardware only company. Solaris and Java are strange kinds of harware. The DoJ obviously don't know much about the industry eh!

subscribe to comp.risks for full text and other interesting postings, many to do with the Y2K problem at the moment. Full information for getting hold of past digests is at the bottom of each edition.

Lionel

I'm sorry, but that is a fault in the OS. It should not let anything crash
the system *ever*. OK, so this is too good to be true, but generally with Unix
systms you have to try very hard to crash the entire thing.

From what you say, Amigas sound just like Lose95, where you have to
unconciously keep track of what tasks you are running and whether they will
crash the system.

User-friendlyness in my book is not a gooey interface, but *stability*. You
can learn any interface, but you are stuck with a crasher however good you

are.

718. "Knigts of the System Table" -- Brand New Online Magazine

Newsgroup: comp.sys.atari.advocacy
Date: 1997-04-09 00:00:00 UTC
From: Oleg Dulin <dulino@polaris.clarkson.edu>
Message-ID: <334C4785.6C82A0C2@polaris.clarkson.edu>
Source record: 6415

"Knights of the System Table" is completely independent unbiased on-line

computer magazine for computer users by computer users. Its goal is to try
to give each computing system equal share of coverage. Computer systems
range from programmable calculators, through palmtops, word processors,
organizers, to laptops, notebooks, personal computers, workstations, and

servers. We will also try to provide programming lessons.

The premier issue will be @ http://www.clarkson.edu/~dulino/knights/ on
April 14th.

Although we are starting from a small bi-weekly publication, if we get
enough hits we'll move to the commercial server and try charging for
advertisements. However, right now we need about three volunteers per
each
computing platform who would provide us with articles, news, columns,
tips-&-tricks pages, etc. twice a month. Eventually, if this venture
turns
out to be a viable one and we move to the commercial server, we'll be
able
to reward those who submit articles. But for now, it is completely
voluntary.

If you would like to become a reviewer or columnist, reply to me by
email.
Please state what would you like to be writing about so that I can set
up
a section for you. Again, we need only three reviewers per each system.

Thanks in advance,
Oleg Dulin

I agree, I never had any problems running 1.3. I liked it, with the 500k
memory expansion
I had, I could set up a RAD disk with the OS, Scribble with its spell
checker. This provided
me with a rock-solid and fast wordprocessing machine.

> Meanwhile, many of us ran 1.3 with few glitches once we'd balanced our systems

Yeh, some games used to crash, but not very rarely.. the ASDG serial
board I had screwed the machine up though.

> As for the 'look' of 1.3 one could make it quite acceptable to practically any taste.
> There were slews of esthetic addons and beautifiers around, most of them in the public
> domain. No two worksessions looked alike in *my* neighborhood. I think the argument
> that the Amiga OS looked 'ugly' is not valid.

I never said it was 'ugly', just explaining that the previous writers
claim that AmigaOS
3 was not radically different from 1.3 with the exception of
improvements in the GUI. I
personally really like 1.3, at the time of its release it had the most
advanced feature
set of any mainstream OS whilst being mature,reliable and efficient. The
only thing better
on the Macintosh at the time was the GUI, but Macs were almost 8x the
price of the Amiga. I
used to hate Mac's.

>
> The main drawback was interlace flicker. This, with a simple add-on could be overcome.
> Considering the multitude of add-ons the msdog machine of the mid-80's needed, I don't
> think it was unreasonable to guage a machine *with* basic add-ons onboard, like the
> flicker-fixer for the Amiga. Nex

The flicker never bothered me cause I never used that mode... However, I
dont think the

flicker fixers can be guaged as a "basic" add-on... They were damned
expensive and required
a multi-sync monitor. I could never afford one and neither could most
people. What was always
the brilliant thing about the Amiga, was that it offered so much and
asked for so little ($$$).
Oh yeh...it also offered free phone calls! :)

Cheers

Daniel Soderstrom.

Well, a machine and OS *should* be able to stand up to such abuse. You
shouldn't have to pamper a computer to keep it running.

>Meanwhile, many of us ran 1.3 with few glitches once we'd balanced our systems
>to our specs. Testing new public domain software would, yes, crash the machine

>in the machine and its OS.

No, it demonstrates that WB 1.3 was not a stable platform for randomly
running the apps available to it. What you are suggesting is that store
employees should spend time getting personal with the system the way you
do at home, weeding out offensive apps and avoiding crashes. This isn't
always practical.

==========

Interesting, but I now realize you're totally hopeless.

What I've spun out is entirely reasonable and very likely to occur.
Most of the technical folks around here agree that Gates will do
exactly what I've mentioned, as this is the easiest way to
rapidly gain a large Web TV userbase. Adding the ability to
feed a PC, as well as a TV, is likely very easy (this technology
already exists and is in use BTW).

Why you decided that a comment on Web TV was somehow related
to OS/2 is way beyond me (and probably most of the planet).

It appears you've decided to extend your "reason for being here"
that you gave us well over a year ago. At the time, you decried
the "bashing" that OS/2 users were doing to users of other operating
systems. Over the last year, I've pointed out numerous time that
you have been doing a lot of "gratuitous bashing."

It appears you've degenerated so far as to assume that anything
said by anyone who uses OS/2 is a good reason to bash that person

"simply because they use OS/2."

The technical term for what you're doing is "bigotry." A bigot assumes that just because a person belongs to one sub-group, they can be discriminated against in all fields of endeavour. Most folks don't like bigots, I sure don't -- go away bigot.

If it isn't! Than we're in for big trouble since the first thing BG
will probaly do is kill-off JAVA (the AMSTRAD-strategy) and replace
it with ActiveX. Or maybe they start charging through ppl the nose
for JAVA-licences whereby these are even more out-of-reach for
smaller companies like Acorn etc... So much for ART's NC and all
major JAVA implementations :-(

I have the nasty feeling that there's going to be a real war by the
end o/t century. Poor against rich. Small agianst big. North against
South. Moslim against Christian. (Big) MicroSoft against the (small
rest o/t) world. :-(

I pray it's a joke!

Cheers

: use that old software from '88 on the card? Will all of your apps take
: advantage of the acceleration features?

All software that was written following Commodore's guidelines
(basically, just be OS-friendly) *does* work on Cybergraphics. Yes,
even software from 1985 will work. Geez, how many times does this
have to be repeated? If you're not going to pay attention to the
answer, then stop asking the question!

AHI is a different matter -- it's a new API and does not change
audio.device, so software has to specifically support it. However,
you could write a new audio.device that linked into AHI to give the
same compatibility as cybergraphics, but AFAIK this has not been done
yet.

As far as capibilities go, the Falcon is still on par with current PC
technology. But the new Phenix is a completely updated Falcon with a
brand new OS.

> Imagine what would of happened if a million were sold.. Falcon users would
> of have not complained about the sorry state of internet and web tools..

And what the crap did does that have to do with hardware? Internet
software is just that, software.

> I know that Falcon users are dumping their midi systems for all
> Mac

HAHAHAHA!!!! ROFLOL!!!!

Come on...a Mac that's more expensive and requires a seperate MIDI
device just to plug the keyboards in...

Falcon's are niche computers...and you better get used to the idea
because when Apple closes down, and it will, Mac's will only be sold
as niche platforms and nothing else.

Tell me...have you even 'used' a TOS computer at all???

Practical or not, it is still a necessity. Microcomputer OSes in
general are no less unstable. They still require some degree of
pampering and even the 'robust' systems require some non-trivial
sysadmin.

Practical or not, it is still a necessity. Microcomputer OSes in
general are no less unstable. They still require some degree of
pampering and even the 'robust' systems require some non-trivial
sysadmin.

I think you meant to write "It was nice": Present tense please,
it *is* nice.

> but was showing the effects
>of less-than brilliant planning during development.

Cough, this can be easily considered one the most severe showings of
ignorance on Usenet ever. Ask software experts from all places, and
they will assure you that the concepts under the hood of AmigaOS are
so elegant and nearly perfect, that they are the main reason we still
have these many Amiga newsgroups today, alive.

>And lastly, I feel so guilty for briging up this last point.... but...
>dont you remember the serial ports! You have to admit they were a joke.

Why? I have no problem running my 28.8 k modem with it. What's your
problem?

>A don't try and mention the multi-port serial boards... I and a friend
>ran an Amiga BBS and we never got the damned thing to work properly.

You must have done something severely wrong, perhaps no real experts
at work? May I inform you that until very recently, the majority of
German BBSes ran on Amigas! And this because of their superior handling
of a *lot* of active serial ports simultaneously, with conventional
modems as well as with multiple ISDN lines via ISDN plug-in cards.
This is the reality!

>Doesn't the doctrine ever change ? I was saying this as an Amiga
>en-feavored teenage saleman in a computer shop. I seem the remember the
>current day competition was the Apple IIGS

Must be a long time ago. Fact is, you can *still* buy current Amigas,
and they do well against the competition and this still in the eyes
of being underpowered processor-wise. If that doesn't show the superiority
of the concept and architecture, I don't know.

>Sunday... Do you think were witnessing the birth of a new religion which

: :
: : Care to point out a single instance where Apple used 16 bit code?

: Apparently you missed an earlier post:

: 16-bit Intel CPUs do have a 32-bit pointer, a far pointer (16-bit
: segment + 16-bit offset). They are much less efficient than today's
: 32-bit offsets but they do work.

You are incorrect. Apparently you've never programmed a 16-bit intel CPU
in assembly. Allow me to correct your mistakes:

16-bit Intel CPUs do have a 20-bit pointer, a far pointer
(overlapping 16-bit segment + 16-bit offset). They are much less
efficient than today's 32-bit offsets, and being only 20 bits,
only let you address 1 MB of memory space. This is where the 1 MB
addressing limit of the 8088 came from. In a pathetic attempt to
improve things on the 286, intel used a 64K "window" located in the
lower 1 MB address space to access memory above 1 MB.

To sum up, on the 8088 you have only 1 MB of memory/MMIO. On the 286
you have either that, or (1 MB - 64 KB) of direct memory/MMIO along
with a 64 KB sliding window into the memory above 1 MB.

A far cry from the 68K architecture indeed.

: ... Allow me to correct your mistakes:

When "correcting" other's mistakes it would be helpful if you understood
the topic. I could provide a reading list to bring you up to speed, feel
free to email me. ;-)

: 16-bit Intel CPUs do have a 20-bit pointer, a far pointer
: (overlapping 16-bit segment + 16-bit offset) ...

In a 16-bit code segment a far pointer is a 32-bit data structure. With
respect to what is referred to today as real mode you are partly correct
that the 16-bit segment and 16-bit offset are combined to form a 20-bit
address. But this is a linear address, not a far pointer as you claimed.
Secondly, in 16-bit protected mode the segment is not combined with the
offset as you described. The segment indexes into a descriptor table that
includes among other things the base address of the segment. The offset is
then added to the base address to form a linear address, not a far
pointer.

: ... They are much less
: efficient than today's 32-bit offsets, and being only 20 bits,
: only let you address 1 MB of memory space. This is where the 1 MB
: addressing limit of the 8088 came from. In a pathetic attempt to
: improve things on the 286, intel used a 64K "window" located in the
: lower 1 MB address space to access memory above 1 MB.

Severly misinformed again, with the 286 Intel introduced 16-bit protected
mode. I refer you to my preceeding paragraph and how the segment and
descriptor table are used to form a linear address. The base address of a
segment as defined in the desriptor table entry may be located anywhere in
the 286's linear address space (which I think was 24-bit).

: To sum up, on the 8088 you have only 1 MB of memory/MMIO. On the 286
: you have either that, or (1 MB - 64 KB) of direct memory/MMIO along
: with a 64 KB sliding window into the memory above 1 MB.

By "sliding window" were you attempting to describe EMS, a bank switching scheme Lotus/Intel/Microsoft came up with to let real mode DOS programs access memory beyond 1M? This was not part of the CPU, it was implemented by the system. The 286 CPU had 16-bit protected mode, numerous DOS extenders and OS/2 made use of it.

: A far cry from the 68K architecture indeed.

Well you did manage to get one thing right, the Intel 80x86 architecture is a far cry from the Motorolla 680x0 architecture. :-) I never truly enjoyed x86 assembly until I started doing 32-bit work on the 386, but still 68K assebly was a much more pleasant experience. I'm still undecided about PowerPC assembly.

No, no, you misread it. He didn't buy Sun, he bought *the sun*. You know, that big ball of fire up in the sky. He plans to control it with an array of NT machines. Yes, the age of darkness is truly upon us.

Postscript support has been there since at least OS 3.0. The networking support
really needs to be improved, they should enhance Envoy and bundle it with
Amigas. Java support is quite unimportant in my eyes. Protected memory would be
quite nice, though. The datatypes can be improved, they should support
incremental rendering. The datatypes have been taken up by the BeOS now, though.
Developing new graphics and sounds chips can be hard and expensive, I think.

>Hope Gateway realizes the potential of what they have in their hands.

I wonder, myself. What were they thinking when theey spent money on the Amiga,
it doesn't generate much revenue, AFAIK, and they don't seem to have any
emotional bounds to the Amiga either...

>current day "buzz words", there has been little architectural change.

ARexx didn't come with the Amiga until OS 2.0, though you could buy it
separately before that. There hasn't been a need for much architectural change
either, since it had from the beginning what most other systems had to add on
later.

>> > Fact is, that the current version of AmigaOs(v3.1) is much faster,better

>to say "quality" was a hallmark of C=). Anyway, its all irrelevant the
>MacOs version numbers are larger, so it must be better.

The A1200 is quite weak nowadays, but it was a real upgrade from the A500. Tack in an accelerator (And of course the HD) and you're off.
I'm not buying your argument over MacOS system versions, that'd mean that the Mac must have been one of the most unusable systems ever if it took 7,5 versions for it to reach today's level.

>And lastly, I feel so guilty for briging up this last point.... but...
>dont you remember the serial ports! You have to admit they were a joke.
>A don't try and mention the multi-port serial boards... I and a friend

I admit they could be in need for buffering, but I've never had any problems using my Amiga's serial port with today's modem speeds. I call Amiga BBSes regularly, and have dabbled at running one myself, and the serial ports have never caused much trouble AFAIK.

>> I don't think it was any more stable than 7.6, I've not had 7.6 for long

The ST GIU was created by Digital Research. It's no worse than Windows.
Anyway, it's strange that the Mac still can't cope with what you spoke about as a teenage salesman.

Nah, not really. I just wish that there'd be some more diversity in the computer field, it's a pity that the two giants of Atari and Commodore have been reduced to the feeble state they're in now.

```
:
: Only in your dreams! The Falcon is stuck on 030 technology and the
: graphics/video subsystem is outdated! This Phoenex is most likely
: overpriced as the Hades is. PowerComputing's PowerCenter
: 150(ppc604/150mhz) for $1499! Price includes CDrom, ethernet

Ummmm...no shit shirlock!
But tell me where I can get into any kind 16 track recorder for less
than a grand I'll buy it! I'm in a Falcon 030 running CuBase Audio for
a grand total of $700. I don't need video...it runs in black and white...
but by dammit, it work...and it works well.

I'm getting really tired of Sinclap comparing systems that came out only
a few months ago, to those that came out in what? 1992?

: > Falcon's are niche computers...and you better get used to the idea
: > because when Apple closes down, and it will, Mac's will only be sold
: > as niche platforms and nothing else.

BTW...I have a Falcon, and Pentium Pro...I really wanted a power mac...
but was able to get into the two systems above for about half the money...
plus, I can get local support that the Mac doesn't offer (as compared to
the Pentium). Last time I shopped, the Mac dealers didn't seem to want
to sell me one very bad...the PC guys were kissing my butt, and dropping
the price another $100 every time I cocked an eyebrow. Also...the PC guys
could tell me what they were selling me, how it worked, and were able to
advise on what worked well and what didn't. The apple sales people just
looked at me like "I was stupid" when I asked them if the system would run
Cubase VST, or what speed processor different models had...etc. When I
asked for Mac brochures, they said they didn't have any...and tried to
sell me a copy of Mac World. The PC guys gave me enough literature on
each system they sold to read for a month.

Apple has a great product...most likely the "SUPERIOR" platform...problem
is...they don't care wether they sell them or not. The few dealers they
have in my area are clueless, and have to tools become educated by.

As much as I hate to admit it...
Apple has a lot to learn from Intel and Microsoft when it comes to
selling computers. 1...don't alinate your dealers, this is what killed
Atari! 2...don't alinate potential coustomers.

Brian

: : : 32-bit offsets but they do work.
: :
: : You are incorrect. Apparently you've never programmed a 16-bit intel CPU
: : in assembly. Allow me to correct your mistakes:

: When "correcting" other's mistakes it would be helpful if you understood
: the topic.

I do, which is why I corrected your mistakes. I can recommend several
books you might like to read, if you're interested.

: : 16-bit Intel CPUs do have a 20-bit pointer, a far pointer
: : (overlapping 16-bit segment + 16-bit offset) ...

: In a 16-bit code segment a far pointer is a 32-bit data structure.

Perhaps in the 386 or later (I never had the misfortune of
programming one of those in assembly), but not in a 8088 or 286.
There is *no* way to access 32 bit addresses in those processors. If
you have ever touched 8088/286 assembly, you'd know that.

: With
: respect to what is referred to today as real mode you are partly correct
: that the 16-bit segment and 16-bit offset are combined to form a 20-bit
: address. But this is a linear address, not a far pointer as you claimed.

In the 8088 assembly manuals, if you specify a segment other then the
default, then this segment + offest *is* referred to as a far pointer.
Near pointers also do the segment + offset to get the address, the
segment coming from the DS.

So, it's not the fact that you did added a segment to an offset to get
an address that makes it near/far (the addition is always preformed),
it's what segment register you used (a "far" segment or a "near"
segment).

: Secondly, in 16-bit protected mode the segment is not combined with the
: offset as you described. The segment indexes into a descriptor table that
: includes among other things the base address of the segment.

This still doesn't get you 32 bit addresses on a 8088 or 286 (or any other 16 bit intel CPU), which is what you claimed.

: Well you did manage to get one thing right

Which is better then you did...

How about the ZX Spectrum emulator that runs in Java on a web
page? I don't have the URL to hand, but it's the best use of Java
I've seen so far...

Indeed. The Acorn NC (and in fact *all* NC's that comply to Oracle's
specifications) contains a Java VM.

Can you point out anything on the web that shows how cool C++ is? Java is a nice language. But, it is just a programming language. It's not going to make your web page look like some Hollywood movie. From what I have seen of it, it is very well designed. Built in GUI elements, complete object-oriented design, many built-in objects, and it is close enough to C++ at it's bsic level to make it easy for me to remember the syntax. Corel has recently come out with it's productivity suite written in Java. i have doubts about the speed of such a thing, but then I am using a 90 MHZ system in a world of 500 MHZ systems. I would look for PCI cards with an actual Java machine on them to start showing up soon. This would allow Java to run native on it's own processor. I would also expect to see more actual applications (as opposed to applets) being sold. There is a huge gain to be made if you can just write one version of a program and let anyone use it on any platform. Just think, no more "You can't get any software for the Mac"!

I think there are already too many diffrent antiMS logos right
now and the number is still growing. We should exhibit all those
logos on one site to let folks vote. The winner logo should
then be accepted and used by all antiMS campaigns.
Suggestions on that?

Well this is a joke, I ran AmiOZ BBS for over 10 years on a A2000 with a
C= 7 port serial card, it worked great all that time.

I was & still am a big fan of the Amiga, it took a lot to change me to a
PC, Windows95 was the main one as it is much like using a Amiga,
somethings are missing like pulling down the screens to get at programs.
but all in all win95 is good.

The fun thing about all this mac v PC v Amiga is this Amiga that is
talked about is near 10 years old, I was using a A1200 long before it
hit the shops. it was great then, but the PC has court up, only because
the Amiga stop getting new hardware/software.

The Amiga was talked about being used in settop boxs back in 1990, so
maybe Gateway will use it in Internet settops, using a browser in rom.
the cost would be very little to make, using a box like a CD32.

You make a grown man cry. I never had an Amiga, until i compiled the
Unix Amiga Emulator on my machine. I instantly liked it.

Hell that Baby can do REAL multitasking. Win'95 can't.
You've just downgraded.

Tom Kennedy (tomk@fc.hp.com) wrote:
: Anthony D. Tribelli (adt@netcom.com) wrote:

: : When "correcting" other's mistakes it would be helpful if you understood
: : the topic.
:
: I do, which is why I corrected your mistakes. I can recommend several
: books you might like to read, if you're interested.

Assuming you've read them once, I suggest re-reading them. :-) You seem to
be having a little confusion with near and far pointers (something a
program operates on), linear addresses (what the CPU derives from a near
or far pointer), and a physical address (what the CPU puts on the address
bus).

: : In a 16-bit code segment a far pointer is a 32-bit data structure.
:
: Perhaps in the 386 or later (I never had the misfortune of
: programming one of those in assembly), but not in a 8088 or 286.

Wrong. A far pointer is a data structure that has a segment and an offset.
In a 16-bit code segment it is a 32-bit data structure, in a 32-bit code
segment it is a 48-bit data strcuture:
When using 32-bit addressing, a logical address (or far pointer)
consists of a 16-bit segment selector and a 32-bit offset; when using
16-bit addressing, it consists of a 16-bit segment selector and a
16-bit offset. [Intel Architecture Software Developer's Manual, Volume
1 Basic Architecture, 1997, p. 3-5].

: There is *no* way to access 32 bit addresses in those processors. If
: you have ever touched 8088/286 assembly, you'd know that.

No one said you could. You're confusing far pointers and linear addresses.
A native far pointer does generate addresses that span the entire address
space of the CPU. For example a 32-bit pointer on a 286 in protected mode
generates a 24-bit physical address, similarly a 32-bit pointer on a
Motorola 68K generates a 24-bit physical address.

: : With
: : respect to what is referred to today as real mode you are partly correct
: : that the 16-bit segment and 16-bit offset are combined to form a 20-bit
: : address. But this is a linear address, not a far pointer as you claimed.
:
: In the 8088 assembly manuals, if you specify a segment other then the

: default, then this segment + offest *is* referred to as a far pointer.
: Near pointers also do the segment + offset to get the address, the
: segment coming from the DS.
:
: So, it's not the fact that you did added a segment to an offset to get
: an address that makes it near/far (the addition is always preformed),
: it's what segment register you used (a "far" segment or a "near"
: segment).

A far pointer is just a data structure, not an operation of any kind. It
is part segment part offset, usually in memory, but sometimes a register
pair like DS:SI, ES:DI, SS:SP, or CS:IP.

: : Secondly, in 16-bit protected mode the segment is not combined with the
: : offset as you described. The segment indexes into a descriptor table that
: : includes among other things the base address of the segment.
:
: This still doesn't get you 32 bit addresses on a 8088 or 286 (or any
: other 16 bit intel CPU), which is what you claimed.

No, you misread and/or misunderstood. I claimed a far pointer was a 32-bit
data structure. I only claim that a far pointer can access the entire
address range of the CPU.

: : Well you did manage to get one thing right
:
: Which is better then you did...

I suggest re-reading this post and my last post.

I'm terrible at drawing, but maybe someone could do something with this:

A Windows-like logo with a brick imprinted "Linux" smashing or just
having smashed through in full flight.

Perhaps the fracture pattern could be remeniscent of the MIT "X" cursor.

Actually, make the brick's imprint any one of many OS's - have one of
these, drawn somewhat differently, for each non-MS advocacy group.

News flash!

There is new hope on the horizon for the Amiga! Gateway 2000 has just
exclusively purchased ALL of the rights to the Amiga.

As of this time, I don't know what intentions they have, but as a multi-billion
dollar corporation (albeit one that I havn't admired much in the past) they
have the potential to develop the Amiga into the system it deserves to be.

Time will tell. So far Gateway 2000 has been married to Intel and Microsoft
(to put it quite mildly), but perhaps they realize that a true independent
identity is a more secure way to stay successfull? Lets hope they don't just
shelf the Amiga for good. A dark and sinister side to this might just be that
they want the Amiga to go away permanently, and what better way than to buy it
and then shelf it!

Man's mind is his basic tool of survival!

The Falcon can be upgraded to 040, don't know about 060. Likewise with the
graphics. And don't forget that the processor is backed up by coprocessors like
the Blitter and DSP.
Centek say that the Phoenix will be cheaper than the Hades.

Why would you need that hardware if you're into music? Cubasis certainly doesn't
need 24-bit graphics. It needs MIDI. Other programs need sound ports, which the
Falcon also has.

>>He can live with such warnings and annoyances, but less with reboots.

Oh, come on. I really don't think anyone "ignores" a
segfault (or equivalent). Since the program is terminated
by the OS, it is difficult to ignore. It is merely more
convenient not to have to reboot a hung machine; one has
a much better chance of locating the bug quickly. Especially
if the machine is doing anything else important or useful
at the same time, as computers with proper operating systems
are apt to be doing. Oh, wait, personal computers don't need
multitasking.

>>But most embedded computers are not memory protected. They use the
>>different approach of Watchdogs or similar precautions.

Well, actually, quite a few embedded applications have the ultimate
memory protection of running code (text) directly out of ROM. Other
systems have physically separate program and data memories (Harvard),
possibly of different speeds or widths. But yes, that's different
from an MMU. Some embedded systems use one of those, too.

"Sinclap," I am not surprised that you haven't responded to my post. I believe we have reached the point in the discussion where you have been proven wrong with clear numbers and clear logic, and all you can do now is either ignore my post or admit that you are incorrect.

I have a dream. One day, you'll prove me wrong about you and actually ADMIT you don't know a damn thing about audio/MIDI on computers. You'll actually come out as a respectful human being and state, for all to see, "I don't know how the Falcon compares to the Mac as an audio/MIDI platform, since I've never used either to create music or edit audio." In this dream, you will become educated to the ways of audio, and will have a revelation. At this point, you will agree "Yes, the Falcon is a good MIDI/Digital audio platform.. no, not as feature filled as the top Mac or PC solutions, and there aren't as many pretty graphics, but it is as well integrated as the top Mac and PC solutions, and costs less money for a pro system." Of course, you will still stay a Mac user, but you will realize that there ARE merits to other platforms other then the ones created by your heros Jobs and Wozniak.

Alas, it's only a dream..

I would never presume to argue with you about, say, whether an Atari, Mac, PC, or SGI machine is better for 3d animation... because I've NEVER DONE IT. Would you criticize a politician for their views on something without researching it? I think not. So, prove me wrong and display that you are a real person.. admit you are incorrect about this.

-Mark

OK, but tell it to StarDivision. They made a relatively clever choice ---
implemented the core engine in C (or whatever) on a selected number of
OSs, and wrote a Java front end for it, running on whatever you care to
run it on --- and the front end can take care of a fair amount of the
non-CPU intensive work. Every test so far says that it is amazingly fast.

Shhhh! Don't spoil all the fun for all of us that have been using
the net since the ST...

The Falcon has more than enough horsepower to deal with what can
travel down the typical PPP line.

Wake us when bandwidth catches up...

Hmm...I like the Amiga and it did have some definite advantages but I would
not go so far as that... It did have a slower processor speed. It didn't have
a hi-res monochrome display at first, it was initially much more expensive,
etc,... Oh, also (and feel free to correct me if I'm wrong here) but a 2 meg
Amiga A1000 in 198X with 512k of Chip Ram could -not- load up a 640k picture
or MOD into memory, is that right?

I'm not even covering the MIDI advantages... :)

Why on earth do you have to be a gun ownership rights advocate
to shun MS? There are plenty of reasons to shun MS that are
actually related to what MS does on a day to day basis. What
Billy chooses to put his own personal money into has nothing
to do with his company.

If you're going to bash MS (a worthy pasttime), then do it right.
Bash them for the stuff MS itself actually does. Trust me, there's
no shortage of things to complain about.

The only reason MS is popular is because the average computer buyer
doesn't know diddly about computers.

Now THAT is a stupid statement.
Gun ownership has nothing to do with microsoft products. It's completely immaterial whether or not Bill Gates likes guns. I believe that the sales of all guns should be outlawed. And I dislike and will not typically use Microsoft products. The two opinions are completely unrelated.

You should rewrite your comment as :

If you are a supporter of increased restrictions on firearms ownership, support causes that believe firearm ownership should be restricted. If you are a proponent of firearm ownership, support causes that support firearm ownership. If you find Microsoft products useful, you should buy MS stuff. If you dislike Microsoft products, you should shun MS.

And then you should take your gun comments to a different newsgroup where they are more appropriate.

I'd be suprised. Graphics and sound have moved on a bit - the architectures
in some of the PC graphics cards are truly awesome: puts the amiga into
perspective. As for sound.... well, when synth manufacturers make PC sound
add-ons, you know they're good.

Zig Zag wrote:
> Java is a joke!

Well, if it's *real* Java applications you want, then there are a few examples available. HotJava is a fully functional web browser written in Java by Sun - the first large Java application to be written. Sun have also produced an IDE for Java in Java, called Java Workshop.

Borland's AppExpert and Debugger for Java are both written in Java.

There are at least two WWW servers available written in Java - Sun's Java Web Server (aka Jeeves) and the World Wide Web Consortium's Jigsaw.

Corel Office for Java (including Quattro Pro and WordPerfect) was available in pre-beta form the last time I checked, though it may have moved on considerably since then. And Applix's Anyware Office is available now, and includes a word processor, spreadsheet, e-mail client and business graphics package.

Your suggestion that Java is a joke might surprise all the companies that have produced Java IDE's, including Microsoft, Borland, Symantec, Rogue Wave, Asymetrix, Metrowerks and others.

Finally might I point you at a URL which might give you a little more information: http://www.sun.com/javastation/customersuccesses/ which gives details of large companies that are using Java (and more specifically, Sun's Javastation) and certainly don't seem to think it's a joke.

Oh, and in future get a clue before posting that sort of offhand dismissal of something you evidently don't know much about. I'm sure you're not particularly impressed when people post 'Amigas are crap and outdated' to all the c.s.amiga newsgroups, so there's no excuse for you doing the same thing.

Adrian

I presume Microsoft funds gun control groups, considering Bill Gates
politics, just like credit card companies like MBNA have funded
Handgun Control Inc. $25,000.00 before. Why not switch to companies
that don't fund odius political groups, or any groups at all?
Corporate funding of political groups and "charities" has had nasty
results, such as the corporate funded ruin of NPR and PBS.

All computer users should be required to have a seven day waiting
period before buying from Microsoft.

Everyone should be allowed to own disk reformatters to protect
themselves from Microsoft's New World Order.

(besides, if I'm pro gun control, does this mean I'm supposed to like
bill? Gack)

Actually there's a strong relationship between guns and M$ products: they
are both dangerous for people's well being.

> has reversed itself and now effectively reads "price without the power".
>
Hmm... yes. It is no longer "power with out the price", It is more like
"power with the price". I've seen and 'played' with a DirecTT60, and it
is
obscenely fast, makes me sick when I am at work on my 166MHz Pentium
w/32
MB RAM processing images. My work machine is just not as fast, as
capable
as the DirecTT, not by a long shot,whether running Windows3.11,
WindowsNT.
Now maybe if there were good DOS graphics programs, it would be a little
closer. If I had a DirecTT60 at work I'd be spending more time drinking
coffee than making it! :^) It is not cheap[2800U$A?], but I don't really
know if
there is "anything" faster in the PC world. maybe a 250MHz Pentium Pro?
And how much is that? about the same price?
so for the money Computer Direct is asking for, it is reasonable - for
professionals only though. The home/hobby buyer would not be interested,
and quite frankly has no use for such a powerful machine. Perhaps the
same
logic would apply to the 533MHz PPC's?

> All sentimentality aside, the reasons most Atarians originally rallied
> around the ST, etc. just don't apply. If you want obscene amounts of
> raw horsepower, rock solid stability, ease of use and an endless supply
> of apps, all at a decent price, you've got to grab a Windows '95 machine
> today. These things essentially have the kind of intrinstic buyer appeal,
> now, that Atari had in its day.
>
the endless supply of apps is a ridiculous argument, in fact it works
against
the PC world as there is so much code that is rushed to market to 'beat'
the competition (i.e.CorelDRAW) that the user is stuck with beta
software
I haven't found anything like Edith in the pC world, maybe I never will
(although Annius is working on a unix version). It's been said before,
but
I will say it again, who cares? how many word-pro apps do you need, or

use?
how may graphics programs? image processing programs? MIDI programs?

Obscene amounts of raw horsepower - yes. the only time you see it in
action
is when you run it in DOS, cuz Windows takes so much power just to run.
For
example, as an illustration of my point I have TurboCAD for DOS, and
TurboCAD
for Windows. I never use TurboCAD for Windows anymore because it is a
pig,
dead in the water. TurboCAD for DOS runs faster on my 386 without a
math
co-pro than TurboCAD for Windows runs on my Pentium. You need that power
just to get off the runway. Incomparison my Atari is like an ultralight!
:^)

Rock solid stability? Maybe for NT4, it looks pretty good. OS/2 is not
so bad
either. Win95? ehh, I've heard and seen conflicting stories/examples.
Win3.1
is dog meat.

Ease of use? Well, I am involved in the training program at the college
here,
and we have to train people to use Win95, it ain't simple and easy to
use,
unless you _only_ want to turn it on, play games, turn it off. Which is
perhaps the level most home users are at, which is all right, that's
probably
all they bought if for. It's all my friend bought it for.
$2,000 to play Duke Nuk'em.

Intrinsic buyer appeal? that's a very truthful marketing statement. :^)

> If you keep your Atari today, do it for nostalgia purposes or acknowledge
> that you like it because it is quirky and cute, but anyone who claims that
> "Atari rules" probably isn't being very honest with themselves.

I don't claim Atari rules. You are putting your words into peoples
mouths here,
just to make a strawman you can knock down. go ahead - knock him down.
feel better :^D
Nostalgia? quirky and cute? I suspect you've never used an Atari
professionally.
>
> I agree with others that, if you have to get a non-Atari machine today to
> get decent access to the Web, etc. don't bother to pick up a Mac. They
> are on they way out too and the history of the Atari is already repeating
> itself in the Mac arena (too bad in both cases - and I state this sincerely).
>
Oh I am sure you are sincere.

for 'decent'(?) access to the web you either need a PC, a MAC, an Amiga,
or
an Atari, maybe an ARM? how about an 8bit Atari? what is 'decent'?
MAC on the way out?
-Webweek 7/10/96 "MAC #1 in webauthoring, 41% market share worldwide
-Lightstone Thompson 1995 84% of most poplar 50 CD's developed on the
MAC
-Dataquest 1996"Multimedia Market Trends" MAC #1 multimedia vendor in
world.
18.8% market share
-Computer Intelligence, 5/3/97 MAC os market share increased by 61.4%,
XXX86
market share decreased by 5.1% over previous year. MAC os market share
8%
in 11/96, 11% in 1/97.
-Griffin Dix Research Assoc. 1996 MAC #1 in Colour Desktop Publishing
with 80%
of market share.
-Georgia Inst. of Tech [macworld 11/11/96] MAC #2 web server in
world(after UNIX)
oh yes. _obviously_ MAC is on the way out.

> Most folks who would rather die than own a PC fall into two groups. First,

> Gates
> Haters).

I admit to both bias. I also admit that I have owned PC's since 1982,
and I
am sick to death of them. I own a 486 now, and the god damned headaches
(i.e. have you ever tried to get two different IDE drives to work
together?)
are just not worth it. From my _experience_ MAC and Atari hardware is
far
more reliable, SCSI all the way. Of course you can buy a decent SCSI
card
for the IBM too. I know that, but I'd rather use the 200$ for something
for my Atari!
>
> If you fall into the latter category, you might find happiest among the

what are you talking about? I somehow don't have access to hardware and peripherals because I have an Atari? Gee, I thought my memory, SCSI hard drives, microphone, Multisync monitor, etc were ordinary peripherals, I guess I'll have to check for the Atari label when I get home! What platform restrictions? Geez, when was the last time you owned an Atari? 1992?

> Flame me if you want, but I can honestly say that as a former die hard

> Keith M.

You are probably quite correct in your last statement. Are you born again?
PC's are the light, the way, and the truth? Have you 'embraced' the PC?
My Atari does what I need to do, quite well, inexpensively, and I enjoy it.
You have your 'opinion' and that's fine. so why are you trying to 'save' me?
why are you trying to convert anyone? Will converting someone somehow *validate* your choice? of a friggin _computer system_??! :^D
ROTFL!

Can't you amiga people stick to comp.sys.amiga.advocacy? I really
don't think you're going to convince many Windows NT, OS/2, or Linux
users to go out and buy amigas.

You could all tell each other how wonderful the amiga is, and you
could all reply back to each other agreeing with yourselves.

I disagree. A gun is a neutral thing, it's the idiot pulling the trigger that does the damage. MS products are harmful in themselves, as numerous W95-install MBR overwrites and drive spammings prove. Another difference is that you can, however, delete the MS from your drive and thus restore it to health. You can't unshoot a gun.

So, you takes your pick there, I guess.

Me, I'm for gun control (and living in a relatively nonviolent place that practices it: Canada) and thoroughly against MS. Though guns are neutral in themselves, there are millions of idiots. As the sales figures for W95 attest ;)

While others have have their fun attacking the good sense of this
posting, count at least one individual who finds Gate$ support
of anti-firearms freedom repulsive. Of course, he has the right
to fund any cause that he chooses. We, the free, also have the
option to choose to not support Gate$.

Thanks for pointing this out...it is another good plank to add
to the platform: "In a world without fences, who needs Gate$?"

Unfortunately one "feature" of uninstalling applications under Win/95 is
the common "megabytes of shrapnel left behind" syndrome.

Win/95 is a smoking gun with you often left laid out in one corner of
your office, reeling in horror from the bullet wound.

How's that for over-stressing a point?
Well... the point that Win/95 and NT are pretty backward in oodles of
ways.

Thomas

To use the same analogy: M$ products are not armful: you need an idiot
to take the CD and install them on your HD...

(and the stupidity of this argument should say something on the stupidity
of guns being neutral objects, not to talk about the inherent stupidity
of this thread :-)

heh - likewise. I've got a Falcon and have been cruising the net
with it for over a year, and have WWW, email, USENET, and FTP covered.
And I now figured out IRC as well. And all without "hack n' slash"
(well, maybe a little work with a text editor :)) Now all I need is a
faster modem.....

maybe Sinclap should consider glueing his feet to the floor so they
won't wind up in his mouth - just like his hero and mentor, Rush
Limbaugh. The man's idiocy has proven to be vast.

Oh, BTW Sinclap, while we're at it, go and get yourself a real ISP.
One that will allow your Mac to use its features, including the ability
to use a proper newsreader (like I'm doing with NEWsie) instead of
having to use Dejanews via Lynx.

Hello folks,

I just have a problem with my shitty joystick and would like to buy
a better one (or two). Actually, I'm looking for the good old KRAFT
joysticks. Does anybody know if there are still stores that have these
kind of joysticks? (I'm asking mainly german ST users, for this kind of
joystick is from Germany, but if you know anything about it, please contact
me...)

Cheers,

Sebi a.k.a The Hidden

Dynamics of Germany produced an excellent joystick called the Competition Pro,
and clones of it for other brands. I'm not sure if they're still around but the
Pro was very popular in England and I bought a clone of it about a year ago (but
the shop has since closed)

You wrote:

> The tools on the Mac are untouchable in the audio world.
> If you dont agree with that, then youre not keeping up
> with the current state of the art in hard disk recorders,
> etc.

Well, no offense, but I have a Pro Tools 4 system, and Avid system, and more that I work on daily. I think I can say fairly safely that I'm well aware of the current state of the art... :)

> The Falcon, as Ive seen demonstrated, is easily
>replaceable by a $700 6100/7100 series PowerMac, or even a
>low end nubus Performa (6116, et c.). The capabilities of
>Cubase, for instance, on both platforms is barely
>comparable.

Again, what you fail to address is a comparison between PROFESSIONAL systems. The Mac's stock converters are crap, (the Falcon's are a bit better at least), but NO pro is going to use either of those for a serious project. What IS important number of INPUTS and OUTPUTS (lots of them) and quality of them.

My point was, and still is, that the Falcon can be upgraded to eight +4 balanced line level ouputs and inputs for well under a grand.. that is not the case on the Mac. The CURRENTLY AVAILABLE cheapest solution to get 8 balanced line level ouputs on the Mac is the Pro Tools Project system, which I've seen used for around $1800. This is because the DSP port on the machine makes building them easier and more affordable. The Mac will catch up, I'm sure, but not yet.

> Both machines, without adding additional hardware (key
>phrase here), provide a stereo in and out.

See above.. "without additional hardware" is pointless if you're serious.

I'm glad you're happy with your Cubase Audio system on the Mac.. I wouldn't be unless I bought a Pro Tools III system as the front end (for around $7k).

Not only are the internal A/D and D/A converters on the Mac not up to par, there also is a big DELAY when listening to previously recorded tracks and trying to record new tracks. In other words, the previously recorded tracks are delayed relative to what you're playing.. something that I am NOT able to deal with, because my music depends on good timing.

> Atari loyalists are a fantastic bunch, but if youre
>genuinely concerned about the bang for the buck youre
>getting from your hardware, take another look at the
>competetion.

Again, no offense, but if the issue is bang for the buck in a professional solution, the Falcon still is the best buy. Yes, there are plenty of solutions with better bells and whistles, but, properly expanded, a Mac is nearly double the price.

More trivia for the pot...

From the April 14, 1997 issue of Computer Reseller News,
pp. 176, "Executive Briefing" column, an article entitled
"For Gates: Thicker Skin, Lawyers With Less Free Time":

It seems that a gentleman by the name of John Leonard
(apparently a critic for "The Nation, New York" magazine
and for "CBS Sunday Morning") recently publicly blasted
Bill Gates for getting his (Leonard's) son, Andrew, booted
off of AOL. It seems Gates was upset by a satire written
by Andrew.

The connection, you ask? AOL recently signed a big IE
deal with MS.

Just exactly who was it that handcuffed you to a Wintel box?? Each and every one of us can make the choice to either use the computer or not. We can each choose to upgrade or not. If we dont want the next new thing, nobody makes us buy it. Some of us made the choice to purchase systems which are well supported, others chose boxes with 3 or 4 apps and are constantly bitching. You were free to make a choice and you made it. If you cant find software or support, that is not our problem.

```
Evidence of behind the scenes arm twisting on the part of MS like this
surfaces all the time. This isn't the first (by a long shot); I don't
expect it to be the last.

What kills me, is that with all of the evidence, if anyone dares
accuse MS of manipulating the press, the MS sycophants and Bill Gates
cult worshippers that infest these newsgroups all join together in
chorus to recite their "That's a conspiracy theory," mantra. Thereby
seeking to impugn the credibility of the message and (especially) the
messenger.

As if calling something a `conspiracy theory' automatically makes the
message non credible. What these apologists deliberately try to gloss
over is the fact that since the dawn of time there have been
`conspiracies', from back office politics, to secret boardroom
meetings, to deals consummated on the golf course, to the
`independent' press serving as the mouthpiece for its editors'
interests.

Well, before we go this far, we should ask if Mr. Leonard indeed
has solid evidence that it was Bill Gates who got his son kicked off.
Did the kid break any AOL rules in the process, or perhaps with some
other postings/emailings/chat activity? And would someone as much in the
public eye as Gates really pull such a stunt, knowing that the world would
find out about it?

I'm not saying that it didn't happen, mind you; but this is a severe
accusation, and like all accusations against someone's character it must be
backed up with evidence. What evidence does Leonard provide?

[stuff about conspiracies deleted]

True. Long live freedom.

> Some of us made the choice to purchase systems
> which are well supported,

Absolutely.

> others chose boxes with 3 or 4 apps and are constantly bitching.

Which boxes are those, then?

Who's bitching?

> You [Manuel Timmers] were free to make a choice and you made it. If

I really think you have misunderstood Manuel's posting. He's not
complaining about lack of software or support.

> > **** Acorn Risc OS Systems: Power to Smart People! **** >

> Lotsa apps and support for all those dummies,

There's no need to be offensive, you know.

The only _direct_ evidence I can think of is the NASA situation where MS'
buddy Garman banned Macs (later overturned by the Inspector General, but
too late to stop them from moving WIndows computers in). Even here, I don't
see any evidence that MS was involved.

I personally don't believe MS _has_ to directly manipulate anyone. They
have marketed themselves into the position that they are considered by the
press and many MIS managers to be the only company that counts. The media
falls all over itself bragging about how MS invented multitasking,
protected memory, the GUI, and anything else related to computing and
create an environment where anyone who criticizes Microsoft is labeled a
loony.

From what I can tell, BG and MS have made no secret of it. This was implied in the article I noted that started this thread. (I rather doubt that CRN would've been so explicit about it if they hadn't the evidence to back it up. Can you say "libel"?)

Then there's the on-line article referenced previously:

http://www.sfbayguardian.com/Epicenter/96_05/052996comp.html

Check 'em out.

831. ADVERTISE TO OVER 100 MILLION PEOPLE FOR FREE!!!

Newsgroup: comp.sys.atari.advocacy
Date: 1997-04-23 00:00:00 UTC
From: nejeh@gdi.net
Message-ID: <5jm9ss$65g@news.gdi.net>
Source record: 6279

Please take the time out to read this email. it is worth your time.

ADVERTISE TO OVER 100 MILLION PEOPLE FOR FREE!!!
Or send a message to millions of people...

NOW YOU CAN ADVERTISE FREE AND GET DRAMATICALLY
MORE RESPONSES THAN ADVERTISING ON NATIONAL TELEVISION

With E-mail your potential customer is forced to read at least the
headline of your letter. Unlike TV, magazines, newspaper ads, and
direct mail where more than 99.99% of the recipients will skip right
over your advertisement.

TURNS YOUR COMPUTER INTO A CASH REGISTER: Conservative estimates indicate
well over 100 MILLION people will have E-mail accounts in the next year!
E-Mail Blaster turns your computer into a cash register by giving you FREE,
immediate access to all of them. Do you think some of the more than 100
million people with E-mail addresses would be interested in your products or
services? Even if you don't have your own products or services you can
still make money buy promoting our computer software!!!
You can make money with our new software called E-MAIL BLASTER

Here's how:
* By Using E-Mail To Sell Your Products & Services
* By Using E-Mail To Sell our Computer Software such as: Email Blaster, Web Walker,
Email Lock Box etc.
* By Renting or Selling Your E-mail Addresses
* By Becoming A Distributor for e-mail BLASTER

MUCH FASTER: With bulk E-mail you get responses back in 1 to 4
days instead of waiting weeks or months like with television or print
advertising. You can begin filling orders the same day you send E-mail.

FREE ADVERTISING WORTH MILLIONS: It costs millions of dollars to mail out
millions of letters using the United States Postal Service! Now you can
send your ad to MILLIONS of people for FREE using E-Mail BLASTER

E-MAIL BLASTER IS ACTUALLY 3 PROGRAMS IN 1: E-Mail Blaster is amazing new
technology and the most advanced bulk E-mail software on the market today.
(1) E-Mail BLASTER automatically extracts E-mail addresses from America
Online, CompuServe, Prodigy, and the other online services, the Internet,
web pages, news groups, and hundreds of other sources. (2) E-Mail BLASTER
automatically stores the E-mail addresses in your computer along with
keywords that describe hobbies and interests to created highly targeted
E-mail addresses. (3) E-Mail BLASTER sends your marketing letter or ad to
MILLIONS of targeted E-mail addresses at the push of a single button!

HOW DOES E-MAIL BLASTER WORK? E-Mail Blaster has dozens of special filters to automatically harvest E-mail addresses from major online services such as: America OnLine, Compuserve, Delphi, Genie, and of course the internet.

AOL AUTO EXTRACTOR: E-Mail Blaster has many special features like the AOL Auto Extractor that let's you use a regular dial-up Internet connection to collect names and addresses from America Online. Collect America Online addresses without being a member. Allows you to download names and addresses from America Online without paying membership fees or online charges. Auto Extractor for all of the online services and Special E-mail database search engines will also be available at no additional charge.

SIMPLE TO USE: E-Mail Blaster does all the work for you. Unlike other programs where you must cut & paste addresses, E-Mail Blaster does it for you automatically. And, unlike other E-mail programs, with E-Mail Blaster there is no need to purchase any additional software

SPEED: Your time is important. E-MAIL Blaster is DRAMATICALLY FASTER at extracting and sending E-mails than all the other programs on the market that we tested it against.

NO SPECIAL EQUIPMENT NEEDED: E-Mail Blaster runs on a PC with Windows 3.xx Windows 95, Windows NT, a 386 or faster processor, 4 MB RAM, and a hard drive with at least 10 MB free and your own SLIP or PPP connection. No other software needed. Also runs on a Macintosh with Soft Windows installed.

****
This message was sent using E-Mail Blaster.

E-Mail Blaster is The World's Leading Bulk E-mail software.
With E-Mail Blaster you can advertise to over 100 million people for FREE!

Cost: We are giving away Email Blaster your only cost is $165.00 License fee.

THAT'S IT!!!

Our company is in the software business of developing cutting edge products, so we know if you have the opportunity to use our software FREE you will be our future customers. We know we need you to make our software business a true success!

(Please if our lists are incorrect put "remove" in the subject and just hit "REPLY" and you will not be bothered again. Please forgive our mistake).

Actually, I found about two months ago that a couple of threads
apparently already running on some other advocacy NGs had just been
cross-posted to the Acorn advocacy group. I don't know whether any
of the other NGs being reached by this thread were added at the same
time, or were already involved in the discussions.

Thus we now seem to be all one big happy(?) band, whether we want this
or not, so I suppose we're certain to get (over time) every possible
Machine A versus Machine B combination, as well as every OS (including
all UNIX variants, no doubt) and will just have to plough through
them.

I actually enjoy reading about the other machines, and sometimes learn
something new -- and occasionally even something really interesting --
but a lot of it is a bit tedious; but that goes with the Advocacy
territory :-|

833. C-Labs MK-I Atari Falcon '030 For Sale

Newsgroup: comp.sys.atari.advocacy
Date: 1997-04-23 00:00:00 UTC
From: dhbutler@tiac.net
Message-ID: <dhbutler-2304971907370001@p12.ts32.metro.ma.tiac.com>
Source record: 6281

I currently have for sale:

* Atari (C-labs) Falcon MK-I 030 with:
- 14mb ram
- PowerUp 32mhz clock accelerator (20% speed boost)
This is only about 18 months old, and is in like-new condition. Will come with all the manuals and software, and in the original box. No Hard Drive or monitor is included. Does include adaptors for both SVGA monitors and the old Atari color monitors (or compatibles)

Other items:

* Apex Media

* Blowup hard-I

* Also I have 4 4mb 30pin parity simms (3 chip simms, not 9 chip)

Make some offers. They go to the highest bidder. You pay shipping in all cases. Would prefer to sell the Falcon, Apex, and Blowup as a package if possible.

Please reply to: dhbutler@tiac.net

[I left Joe's entire second paragraph for context.]

I don't know, Joe. I'll admit that a goodly portion of the industry press seems to be in love with MS, but MS *does* take some hits as well. I've generally found that the more clueful (sp?) the publication, the more realistic its coverage.

And then there's advert dollars--ever a factor in how most publications cover the "news".

As for IS folk: I don't think that IS, in general, is quite so enamored of Wintel as you seem to feel they are. In fact, from *my* reading, a significant portion of professionals in the IS field are quite suspicious of Wintel. (Most with what they feel to be good cause.) Whence most of the pressure to deploy Wintel comes is from the bosses of these IS professionals. These managers and execs are largely clueless as regards the intricacies of Enterprise systems architecture and management--but they *do* watch TV.

[Btw: MS knows this. That's why they've been targeting the managers/bosses of IS folk, rather than the IS folk themselves. I no longer have the cite, but MS admitted to this strategy quite some time ago--admitting that they had gotten precisely nowhere with IS professionals.]

As to "anyone who criticizes Microsoft is labeled a loony."?
Hmmm... I don't know as "looney" is quite it. We're generally
labled as "anti-Ms bigots", "unrealistic", "out-of-touch",
"UNIX bigots", "control freaks", "name-your-favorite-non-Ms-
bigot", or whatever. But the only opinions I really care about
are those of my colleagues. These are the only folk who are
sufficiently clueful to have the right to question my judgement.
And you wanna know something surprising? Even many of the
"Wintel-heads" I know find many of my concerns regarding Wintel
largely justified. (We mainly disagree about what can be
done, is fighting it worth it, and the like.)

But then again, I've been told by many "Wintel-heads" that
I'm one of the "less rabid" (read: "more rational") UNIX-
heads. I suppose that's a compliment :-).

Any way, I don't see things looking quite so bleak as you do,
Joe.

Regards,
Jim

You sure run in a different crowd than I do.

Our entire MIS group fawns over MS technologies. Every time we have a problem, their solution is to spend a few tens of thousand dollars more on Microsoft products. When they couldn't make cc:Mail work, they wanted to run to MS Mail. When they couldn't make Netware work, they wanted to dump it in favor of NT. They are _constantly_ trying to get us to dump all of our Macs for Windows--in spite of the fact that the Windows computers cause probably 10 times as many problems (for roughly equal numbers of computers).

OK. Choose your phrase. But it all adds up to the same thing. I opposed putting MS Mail in and suggested that running from Netware that we couldn't fix to NT wouldn't necessarily solve the problem and got creamed for it.

> are those of my colleagues. These are the only folk who are
> sufficiently clueful to have the right to question my judgement.

Unfortunately, that's not true. You also have to impress your upper management. If the MIS group is constantly fawning on MS and MS spends a gazillion dollars on advertising, you start out in a very difficult position.

I don't see things as completely bleak. I _do_ see that it's an uphill battle. Rhapsody will help, but there will still be a ton of MS bigots to deal with.

>Do you think a 260ST can do it ?;->

AFAIK, the 260ST was never released fully. I was one of the first ST owners
in my area and it was a 520ST that I got. The point I was trying to make was
that all Ram is available under TOS whereas under the Amiga OS/Chip Ram set-
up, it is not... Like I said, I like the Amiga... :)

PS and yes, TOS does load up, but I'm talking about
memory that is shown from the desktop is fully
available for use...! :)

There are different ways to force people into doing something. You can use the same tactic that the "catholic church" did in the middle ages across Europe. Sillence *any* concurent opposition thereby creating ingnorance! It's simple; *if* you don't know that anything better excists and where you'll find it, then you'll be happy with the worst (especially if it's the only one!).

> every one of us can make the choice to either use the computer or
not. We
> can each choose to upgrade or not. If we dont want the next new
thing,
> nobody makes us buy it. Some of us made the choice to purchase
systems

Yes they do makes us buy! I'll give an example:

In 1991 I bought an Atari PC4 (an 80286 AT pc-clone). These systems came equipped with Windows 3.0. Since I performed GFX-design I used Coreldraw 2. However I had severe problems with that program (everyone knows about that buggy CDRW2). In 1992 Corel released V3 which had several bug-fixes. So I wanted to upgrade my Coreldraw.

Guess what I discovered? This CDRW wouldn't work with my Windows3.0 (it needed 3.1). I had to "upgrade" my Windows too. But... Windows 3.1 doesn't work with 80286 pc's (the least was a 80386SX). So in the end I was FORCED to buy an entire new PC while all I wanted was a less buggy Coreldraw.

> which are well supported, others chose boxes with 3 or 4 apps and

Anybody (or any group) that "fawns over" *any* particular
technology ought to be suspect. But the folks that would
have to be suspicious would be their bosses. And as I've
noted, these folk generally get their IS "information" from
TV commercials and the like.

> Every time we have a

It's really rather amusing, to me, at least, how that works.
I've seen it all over the place. In a heterogeneous Enterprise
environment, Wintels seem to always cost the most to support
on a per-seat basis. But when "how to reduce costs" comes up,
the answer always seems to be "spend more money on Wintels."

Go figure.

No. I don't, actually. What I have to do is *advise*
management as to the best course of action and explain,
in terms they can understand, the basis for my conclusions.
If they then choose to take a different course of action,
it is my responsibility to make *that* work as best I can.

I'm not out to impress anybody.

And I don't argue with 'em anymore. (Except where security
is concerned.) I give 'em *exactly* what they demand :-).

And the MS aficionados no doubt think you a Mac bigot. And
you'll both call me a UNIX bigot, I imagine.

I don't really care about the bigots. Bigotry is a state of
mind that results from ignorance and irrational thinking. Or
a utter failure to think at all.

>who criticizes Microsoft is labeled a loony.

I have *never* seen anyone in the press claim that Microsoft created multitasking, OR the GUI, OR protected memory. If nothing else, things like the Amiga and Apple are common knowledge, even outside the computer savvy types. And the label "loony" is not used because someone uses system X; it's used when a system X user starts saying outlandish things. People don't get called lunatics for using Linux; but if they claim that Linux will crush OS/2, NT, and Win95, destroy Microsoft by 1998 and make Bill Gates a pauper, while the rest of the world is running Linux Alpha boxes, THEN the phrase "loony" starts getting bandied about fairly quickly.

There's a fairly inflamatory article in the Times (you can see it at http://www.the-times.co.uk/news/pages/Sunday-Times/stiinnsnd01001.html?1202653) that shows how the man on the street draws the battle lines. There are a few unfair positions (like "digital freak show"), but by and large, a lot of the points are on the mark, in terms of how the average consumer sees the OS wars.

:) He has been more civil lately. There was a time when he really pissed me
off. I may cuss and rant and rave with him now and then, but it is all fun
for me. I know I have it better than him anytime of the day or night:).
He has probably been kicked out of every social atmosphere he has ever been
assoicated with. Egad, it must be terrible to be an outcast from your own kind.
Maybe he ought to really think about purchasing Magic Mac. Even being the lout
he is, at least then I wouldn't think my time wasted if I steeped overhim
here.

Mike

This is the 21st century (almost), we have the internet, and millions of people with a viewpoint use it (including yourself). Please explain exactly who is "silencing" you or the company, os, way of life, whatever you espouse. Silencing and ignoring are two different thiings. Just the fact that we are having this virtual conversation disproves your ignorance through silence theory.

It's simple; *if* you don't know that anything
> better excists and where you'll find it, then you'll be happy with
> the worst (especially if it's the only one!).

Please define better. Does that mean faster, more stable, less conflicting, better supported. Does it mean them all or something else.

Was that a conspiracy, or did 3.1 have features CDRW3 needed to run?

I had to "upgrade" my Windows too. But... Windows 3.
> 1 doesn't work with 80286 pc's (the least was a 80386SX).

I ran 3.1 on the Packard Bell 286 16Mhz my parents gave me 5 years ago. I
also ran corel 3.1 on it. BTW, the floppy from that 286 now resides in my
P166.

So in the
> end I was FORCED to buy an entire new PC while all I wanted was a

No, you just didnt try turning off 386 enhanced mode on 3.1 on your 286. A
little research would have saved you money.
.

<snip>

We are not ignorant of things not microsoft. I for one kinda got excited
when rumors of Apple buying Be were rampant. I could use something like Be
on a fast PPc if it was well supported. Hell even Rhapsody might be ok,
but dont tell those crazy mac guys I said that.

Yes, I have surfed around the acorn pages enough to see you dont have the
software I need, nor the software I like. Show me the AutoCad or Photoshop
quality apps on the acorn.

>Anybody (or any group) that "fawns over" *any* particular
>technology ought to be suspect. But the folks that would
>have to be suspicious would be their bosses. And as I've
>noted, these folk generally get their IS "information" from
>TV commercials and the like.

The bosses often instigate the problem. I've seen cases where the boss says "we need PC people", and PC people get hired without regard to whether or not they know anything else, so chances are you end up with a PC only person. Second, the boss wants to save money, so they hire someone young; and young people are much more likely to not even know that anything other than Wintel exists, much less be able to work with them (I've seen very few MIS people over 40 who were gungho on Microsoft).

Finally, a lot of times MIS departments grow from nothing, and grow the sorts of people needed the most. Often, the software development department doesn't need lots of MIS support, so they may have one person who keeps the mainframe or workstations alive; but the executive pool needs tons of handholding, so more and more PC helpers get hired (or Mac helpers). So after awhile, MIS gets dominated by Wintel centric people, and the UNIX/VMS/Mainframe people are fighting a holding battle.

What's ironic is that the state of corporate computing has come nearly full circle. The PC initially gained popularity because it allowed you to do computing without MIS getting involved. Then departments got people to manage their machines, and then pretty soon MIS started managing all the PC's. And now we're real close to the state where network computers will be common, at which point things will be almost the same as the old mainframe oriented MIS.

Actually you're wrong. Win-3.1 does run on a 286, (I do it) but I guess that
just underlines M$ marketing machine!

856. FORSALE: Atari Falcon030

Newsgroup: comp.sys.atari.advocacy
Date: 1997-04-27 00:00:00 UTC
From: Greg Linder <fluke@mcs.com>
Message-ID: <Pine.BSF.3.95.970427181256.28720A-100000@Mercury.mcs.net>
Source record: 6205
Cross-posted to: comp.sys.atari,misc.forsale.computers.other.systems,misc.forsale.computers.other.misc,misc.forsale.computers.other,comp.sys.atari.advocacy,comp.sys.atari.st

I have forsale the following system, approximately four years old.

Falcon Information:

System Contains:
Falcon 030 motherboard with:
* 4 megs ram
* 68881 Mathco processor

365 meg SCSI HD(2nd 3.5" bay)(4 partitions full of software)
1x CD-ROM(1 5 1/4 bay)
1.44 meg floppy(1st 3.5" bay)
2 open 5 1/4 inch bays, 1 open 3.5" bay

This machine was recased by me, and the ports that I chose to
bring to the rear of the machine are:
Audio in/out(left/right RCA jacks) NOTE: THE only problem with
this machine, and the only thing that has _ever_ given me trouble on this
computer has been the left audio input channel. I think it is the plug
on the motherboard, but I am not quite sure.
Another note about audio:
There are three front panel switches, one turns on/off internal
speaker, one switches audio input to the mothberboard between the internal
CD-ROM audio out and the raear panel audio in. The third switch deals with
switching the Falcon motherboards audio out between the audio out RCA
jacks and the headphone jack, also located on the front panel.
The reset switch on the front panel functions.
The keyboard is a TT030 keyboard, missing the F8 keycap. This
keyboard has a keyboard reset switch installed internally, accesseble via
the plug bay at the rare of the computer.
Video out with Screenblaster installed internally is brought to
the back panel.
Parallel/Serial brought to back panel.
MIDI in/out brought to back panel.
Composite Video brought to back panel.

This machine works, and I shall include with it:
*VGA 15 pin video adapter
*ST monitor plug adapter
*All necessary cables
*No monitor
*All manuals/original disks that I can find.

Bidding starts at $650. I shall sell the system for the best
offer.
Greg Linder

The internet is a tiny proportion of the computing world. Especially
those that also READ these usenet groups.

> exactly who is "silencing" you or the company, os, way of life,
whatever
> you espouse. Silencing and ignoring are two different thiings.
Just the

Ask Epson, HP or Canon to write for example an Acorn driver for THEIR
printers (or a Nextstep driver for that matter)? Back in the 80's it
wasn't a problem to get a printer running on several totally
incompatible systems. Nowadays they turn away if ain't talking
Micro$oft language.

> fact that we are having this virtual conversation disproves your
ignorance
> through silence theory.

That's only you and me. And *do* you really *know* an Acorn machine? Have you *ever* used one let alone seen one? I have used (and owned) PC, Amiga's, Atari's etc...

> It's simple; *if* you don't know that anything

> conflicting, better supported. Does it mean them all or something else.

Indeed. Faster (though I prefer the term smooth or prompt), indeed very stable, less conflicting, better supported (though that word probably has another meaning for you).

The response time taken for a certain action to occur is much shorter on Risc OS. The co-operative multitasking (which shares concepts also available on pre-emptive counterparts) was in it's early incarnation one o/t most stable of its time, today it's a very mature OS which still matches and even outperform most other OS's with real time anti-alliasing of text and graphics, real time solid window handling, the most simple to use and most powerfull drag and drop system between ALL applications etc.... Less confilcting because on the contrary to a certain Micro$oft OS, where ONLY Micro$oft applications multitask properly together, on the Acorn platform *all* apps multitask fluently! Better supported: I have more contacts with developpers than you, i can give them *personallly* suggestions which may (or may not) be included in future versions (ask any user of for example the Prophet accounting package that i use to run my business)

...lucky you... I (and many other) 286 owners never could run Windows 3.1 and certainly NOT Windows 3.11 (WfWg) to work on an 80286. AFIAK The only windows that could run in "standard" mode was 3.0

Why should I have to know the inarts of a suposedly "userfriendly" OS/shell and turn it off manually wereby my "forced" Coreldraw 3 couldn't be installed? Couldn't Micro$oft make it automatically detect what system I had (and thereby turning of the functions that weren't available)?

like Be

What do you mean by supported? Do you mean: If I could COPY software from friends and relatives? Or do you mean: If I have a problem I *telephone* the programmer and ask him to help me (though in my case, I live abroad, email is more convienent)?

I opt for the latter. BTW. Have you ever called the Micro$oft helpline? Or the Corel helpline?

> on a fast PPc if it was well supported. Hell even Rhapsody might
be ok,
> but dont tell those crazy mac guys I said that.

Be is only in prototype phase. Consumer apps won't be available untill the system hits the street. Anyway somebody must be willing (or enough openminded) to program ANYTHING on these new systems otherwise it's a vicious circle. If U keeps saying "I won't buy it

untill well-known companies start writing software for it" and these companies say "we won't write software untill more sales have been generated" then nothing will happen and progress ends :-(

Also it's not because a well-known company writes a piece of software that this software is automatically good.

> >
> > That's what *you* think... but then again. You don't KNOW any better,

> quality apps on the acorn.

PhotoDesk 2 is an excellent "professional" image processsing/ photo retouching/pianting package. Have you ever USED it? Since I'm only into DTP work I can't really comment on Autocad style of software. I know that we have our share of CAD/CAM applications but these are of no interest to me (except for the occasional 3D rendering job)

Nonetheless you seem to forget that a fully working Autocad system is NOT the average cheapo WIntel system that the punter has in their homes! I'm talking of a home computer here costing a mere 1300 UKP for a 200Mhz 32-bit Risc system. A system perfect for the soho market with (on the contrary to what you believe) professional software for a very good price.

What does your PhototShop costs? I guess a lot more than 270UKP (VAT included) What does your Autocad cost (I ain't talking about the light version)? The 3D design package that I use cost 99 UKP. And that's a real time 3D modeller/rendering package with a few features key listed here:

-real-time manipulation of bezier surfaces and spheres, with full controll over U and V parameters for shading.
-Real time operations of ALL tools: No preview
-graphics engine suporting Wire-frame (uniform and shaded), uniform fill, Gouraud and Phog shading, texture mapping and true transparancy, plus a true-colour mode (able to manage several light sources, materials, etc...)
-two real-time lattice deformation tools
-real time texture mapping
-animation
etc....

See my page for a few examples of what can be achieved with Acorn systems.

The rotating RPC-logo and the rotating "new"-gif, the Starlight-logo
on my personal pages as well as the entire page design, backgrounds
(if any), buttons are all made with Acorn software.

Hmmm... I've been working in IS for the last few years. I can testify
that the IS departments I've worked for are extremely distrustful of
Microsoft.

Microsoft has a history of putting out unreliable "solutions" with a
high cost of ownership. It is hard enough to live with this sort of
thing on the desktop, let alone on a server platform.

So I generally find myself in a situation where the majority of
desktops run an MS operating system. High-end workstations and
servers run some flavour of UNIX. Not ideal, but desktop users can
simply reboot when their machines lock up, crash, etc. This sort of
thing is unacceptable for servers.

Windows 3.11 will run only in 386-enhanced mode. However, Windows 3.1 will run without trouble in standard mode (I know this because I have to run it in standard mode to get it to work under the Linux DOS emulator). Windows 3.0 also supported "real" mode, which would run on an XT(!) provided that you had an EMS card with enough RAM on it.

I'm sure 3.1 ran on 286's. Maybe not very well, but it did "run".

Perhaps you're thinking of Windows for Workgroups 3.11? IIRC, that ran only on 386+, and after it had been on the market for a while Microsoft pretty much dumped Windows 3.1 in it's favour.

(Of course, Corel 3.0 may have need to run in "386 Enhanced" mode, in which case you needed a 386...)

OTOH, it was not uncommon (and continues to be fairly common) for the price of a Microsoft OS to be included in the price of "name-brand" PC's - frequently you cannot get a discount on the total price of the package if you do not wish to purchase the Microsoft OS.

But there certainly is an Amiga Persecution Complex, and it's best avoided by other advocacy groups. All the same, it's difficult not to become paranoid when everybody is out to get you...

I have a Mega STe mother-board, i have questions please
answer me, because i want take advantage of the board..

what type of HDD's for Mega STe can i use? internal,
external,removable-media..
what type.? : need special connector? (prices)
Exist IDE adapter for Mega STe?

Can I connect a ET4000 with Crazy Dot to Mega STe??
how cost Crazy Dot ?
how cost ET4000 ?

what monitor i need if i can connect Crazy Dot & ET4000 to Mega STe??
what monitor? with some special connector?
Is Nova Graphics card a good choice?

exist differents types of cases for Mega STe..??
what type desktop? tower? (prices) ..what case i need if a want connect
ET4000 & Crazy Dot to Mega STe Motherboard??

what languages & kits exists for Mega STe to programming??(prices)
(like C++,C,java,perl,databases..)

I know that megaste motherboard came with TOS 2.05..then the question
is ...which are the differences between it and TOS 2.6.???

I hear that megaste have keyboard input..... what type of keyboard
....an "atari-keyboard" or "PC-keyboard"?? (what is the cost of each)

Can I up the speed of Mste ??? (16Mhz to 32Mhz)

Thanks very much to anyone that answer my questions. Good Bye Friend./

PS: Sorry for my english./

For C I would recommend Lattice C 5.6, which is very complete and documented in english. Price is about $200, but it may vary.

Not too many fundamental flaws. The fact that Intel makes a cheaper chip
that is typically 30% slower but has most of the market share for
general purpose desktop computing, and sells it at a decent price, has
kept RISC from permeating the general purpose computing world. It is the
defacto standard for supercomputers, and low to high end workstations.

The problem is that you need dramatically higher bus speeds to
compensate for
larger code size. Same thing with memory. It doesn't make sense,
generally, to
opt for a moderately faster, dramatically more expensive system.

Re: ATARI 1040 ST-fm First Word Plus Help Request

Dear Atari Folks,

I'm trying to help an older gentleman who invested in an
Atari machine for word processing many years ago.

I need your help to find information about how to "export"
several large, important documents from First Word Plus (the
word processor) on the

Atari 1040 ST - fm (platform)

to any DOS or Windows MS Word, Wordperfect or ASCII format.

If you cannot advise, I may have to *print* the documents
and then scan them with OCR! I'm hoping you may have a
better, more straightforward solution?? Please?

Thank you, in advance, for any advice you may supply.

Pax,

Part of the "Amiga Persecution Complex" (you can substitute "Paranoia" for "Persecution" IMO) is justified. Part of it is not. While it's true that Wintelism probably had a lot to do with the fall of Commodore, Commodore, for the most part, did themselves in. Or at least did a lot to damage their own cause.

Question the average *knowledgeable* Amiga-head on whom they'd like to see hung by their thumbs, and I'll bet they'd as soon name certain ex-Commodore execs as any particular Wintel Conspiracy Participant.

Put the blame where it belongs.

There's a whole slough of them. I liked Jed, back before I found a
real GNU Emacs for NT. It was a lot better than "Micro Emacs" and the
other stuff out there, especially if you're used to GNU.

Some time a gome, I opened a Dos prompt from Borland Pascal (Protected mode),
to run windows 3.11. Result:

C:\> win

"To run windows from a protected mode program, you need to run in standard
mode. Please start with WIN /S"

Nice, I thought, that's the first time windows has actually told me how
to fix a problem.

C:\> win /S

"This version of windows can not run in standard mode"

Well, next time a program tells me how to fix a problem it better work...
(Shortly after I installed Linux, and everything is running smooth (see
.signature)).

Kent

If you have access to a Macintosh, there is a great PD progam out called 1st Word Plus RTF. What this little gem does is take a 1st Word file and creates an RTF (rich text file) that most major Mac WPs can read (like Claris Works-MS Word-Wordperfect) from there you can then save them to a PC disk and use on an IBM(if you need to).

Hope-this-helps :-)

> choice!"

Well, they can choose between last month's version of the CPU and this
month's, they can choose whether to have a 2 GB disk or a 4 (or even
more) GB one, whether to have more than the new recommended minimum of
32 MB of RAM, and they can even choose to be *really* daring and buy
non-Microsoft main apps -- some still do this, I believe.

So there is a sort of choice even in the Wintel market, though not a
very enticing one for some of us here, I must admit.

Thankfully I don't have to go that route, but my poor people at my old
work had and still have *no* choice. They don't even have anyone to
show them how to do things any more, ever since I was made redundant.

Now they really /do/ deserve our sympathy.

I think there is a rule against writing such calm and interesting
articles in threads like this one. You'll be reported to the Cabal.

Personally I'm interested in VLIW technology, because it moves a
lot of the optimization work to the compilers
(/interpreters/programmers). I suspect that will be a huge win
because competition between compiler-writers and so forth can be
separated from competition between CPU designers. Also it will
mean you can install new optimizer software and have a faster
system than you did 30 minutes earlier. That should boost
competition, too.

I still remember when my professor in University spoke about
superscalar versus VLIW and stated that theory and experiment both
indicated that they were about equivalent in efficiency, but that

CPU designers like himself didn't like the "let George do it"
philosophy of VLIW. It immediately sounded to me like the decision
to do optimization in the CPU instead of in the compiler was
motivated more by this desire to do everything yourself than by
sound engineering principles.

(Basically, sound engineering principles say that you should _not_
do everything yourself.)

I'm a bit skeptical about Merced though, because it has not _one_
but _two_ millstones of backwards compatibility in addition to the
complicating modality of MMX.

It is perhaps fortuitous that interest in Java has spurred
commercial development of optimization techniques...

>(/interpreters/programmers).

This was one of the original tenets of RISC, you may recall. I agree with the idea of putting much optimization in the compiler, but that optimization should be very high-level (on the order of long range dataflow structuring).

I don't believe VLIW will ever take off. Let me explain.

All VLIW does is offload instruction dependency management from the dispatch mechanism. In this way VLIWs are much like branch delay slots -- they assume a limited lookahead capability of the CPU. If you intend to look farther ahead than the number of instructions in the VLIW you have to put that dependency checking back in, which negates the whole advantage.

Today's CPUs are already quad-issue and some have lookahead much farther than that, very often crossing branch barriers (which VLIW will not). With VLIW practically limited to two or three instructions by typical instruction interdependency it just won't outperform existing systems, much less future systems. Furthermore it causes gaps in the instruction stream, adding additional burden to the memory requirements during instruction fetch -- already a critical resource.

If there's one thing that Intel has shown it's that you can do a damn good job with superscalar, superpipelined systems with sophisticated instruction decode, dispatch, and branch management. Expect to see more of that, as well as systems which are much more cavalier in their calculation of instruction sequences following branches that might not be taken.

maybe not, I am looking foward to Lightwave3D 5.5 myself, and so are
THOUSANDS
of other people, not just with 95 or NT, but with MacOS, Solaris, and IRIX
on their machines.
MainActor is available for NT also, much nicer than the Amiga version.

I got an A3000 Vlab Motion Complete system I am dumping.
Comes with 12 years worth of Amiga stuff Ive collected.
Anyone interested?

881. All you need is to invest $5 for a FORTUNE!!! ACT NOW!!!

Newsgroup: comp.sys.atari.advocacy
Date: 1997-05-03 00:00:00 UTC
From: Peter Sung <fantasia@hula.net>
Message-ID: <336B188D.25ED@hula.net>
Source record: 6230

A little while back, I was browsing these newsgroups, just like you are now, and came across an article similar to this that said you could make thousands of dollars within weeks with only an initial investment of $5.00! So I thought, "Yeah, right, this must be a scam," but like most of us I was curious, so I kept reading. Anyway, it said that you send $1.00 to each of the 5 names and address stated in the article. You then place your own name and address in the bottom of the list at #5, and post the article in at least 200 newsgroups. (There are thousands) No catch, that was it.

So after thinking it over, and talking to a few people first, I thought about trying it. I figured what have I got to lose except 5 stamps and $5.00, right?

Like most of us I was a little skeptical and a little worried about the legal aspects of it all. So I checked it out with my country Post Office, and others had with US Post (1-800-725-2161) and they confirmed that it is indeed legal!

Then I invested the measly $5.00.....

Well GUESS WHAT!!... with in 7 days, I started getting money in the mail! I was shocked! I still figured it would end soon, and didn't give it another thought. But the money just kept coming in. In my first week, I made about $20.00 to $30.00 dollars. By the end of the second week I had made a total of over $1,000.00!!!!!! In the third week I had over $10,000.00 and it's still growing. This is now my fourth week and I have made a total of just over $42,000.00 and it's still coming in .....

It's certainly worth $5.00, and 5 stamps, I spent more than that on

the lottery!! Let me tell you how this works and most importantly, Why it works....also, make sure you print a copy of this article NOW, so you can get the information off of it as you need it. The process is very simple and consists of 3 easy steps:

STEP 1: Get 5 separate pieces of paper and write the following on each piece of paper "PLEASE PUT ME ON YOUR MAILING LIST." Now get 5 $1.00 bills and place ONE inside EACH of the 5 pieces of paper so the bill will not be seen through the envelope to prevent thievery. Next, place one paper in each of the 5 envelopes and seal them. You should now have 5 sealed envelopes, each with a piece of paper stating the above phrase and a $1.00 bill. What you are doing is creating a service by this. THIS IS PERFECTLY LEGAL!

Mail the 5 envelopes to the following addresses:

#1 B.C. Smith

P.O. Box 170

Greenland, AR 72703

#2 Beddingfield, Bobby

12404 Nokesville Road

P.O. Box 40

Nokesville, Va 22123

#3 Keen, Callye

44181 Bristow Circle

Ashburn, VA 20147

#4 Tom, BDB.

Via Damiano Chiesa 10

00010 Marcellina (Roma)

Italy

#5 H. J. Sung

1839 Keeaumoku St.

Honolulu, HI 96822-3004

STEP 2: Now take the #1 name off the list that you see above, move the

other names up (5 becomes 4, 4 becomes 3, etc...) and add YOUR Name as number 5 on the list.

STEP 3: Change anything you need to, but try to keep this article as close to original as possible. Now, post your amended article to at least 200 newsgroups. (I think there is close to 25,000 groups) All you need is 200, but remember, the more you post, the more money you make!

Don't know HOW to post in the newsgroups? Well do exactly the following:

FOR NETSCAPE USERS:

1) Click on any newsgroup, like normal. Then click on "To News", which is in the top left corner of the newsgroup page. This will bring up a message box.

2) Fill in the SUBJECT with a flashy title, like the one I used, something to catch the eye!!!

3) Now go to the message part of the box and retype this letter exactly as it is here, with exception of your few changes. (remember to add your name to number 5 and move the rest up)

4) When your done typing in the WHOLE letter, click on 'FILE' above the send button. Then, 'SAVE AS..' DO NOT SEND YOUR ARTICLE UNTILL YOU
SAVE IT. (so you don't have to type this 200 times :-)

5) Now that you have saved the letter, go ahead and send your first copy! (click the 'SEND' button in the top left corner)

6) This is where you post all 200! OK, go to ANY newsgroup article and click the 'TO NEWS' button again. Type in your flashy subject in the 'SUBJECT BOX', then go to the message and place your cursor here. Now click on 'ATTACHMENT' which is right below the 'SUBJECT BOX'. Click on
attach file then find your letter wherever you saved it. Click once on your file then click 'OPEN' then click 'OK'. If you did this

right,

you should see your filename in the 'ATTACHMENT BOX' and it will be shaded.

NOW POST AWAY!

FOR INTERNET EXPLORER:

It's just as easy, holding down the left mouse button, highlight this entire article, then press the 'CTRL' key and 'C' key at the same time to copy this article. Then print the article for your records to have the names of those you will be sending $1.00 to.

Go to the newsgroups and press 'POST AN ARTICLE' type in your flashy subject and click the large window below. Press 'CTRL' and 'V' and the article will appear in the message window. **BE SURE TO MAKE YOUR ADDRESS CHANGES TO THE 5 NAMES.** Now re-highlight the article and re-copy it so you have the changes.... then all you have to do for each newsgroup is 'CTRL' and 'V' and press 'POST'. It's that easy!!

THAT'S IT! All you have to do is jump to different newsgroups and post away, after you get the hang of it, it will take about 30 seconds for each newsgroup!

REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE!! BUT YOU HAVE TO POST A MINIMUM OF 200

If these instructions are too complex to follow, try Forte's "Free Agent." It is freeware for noncommercial use. To download it, simply use a search utility and type "Forte Free Agent". You should be able to find it.

That's it! You will begin receiving money from around the world within days! You may eventually want to rent a P.O. Box due to the large amount of mail you receive. If you wish to stay anonymous, you con invent a name to use, as long as the postman will deliver it.

JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT.

Now the WHY part:

Out of 200 postings, say I receive only 5 replies (a very low example). So then I made $5.00 with my name at #5 on the letter. Now, each of the 5 persons who just sent me $1.00 make the MINIMUM 200 postings, each with my name at #4 and only 5 persons respond to each of the original 5, that is another $25.00 for me, now those 25 each make 200 MINIMUM posts with my name at #3 and only 5 replies each, I will bring in an additional $125.00! Now, those 125 persons turn around and post the MINIMUM 200 with my name at #2 and only receive 5 replies each, I will make an additional $626.00! OK, now here is the fun part, each of those 625 persons post a MINIMUM 200 letters with my name at #1 and they each only receive 5 replies, that just made me $3,125.00!!! With a original investment of only $5.00! AMAZING! And as I said 5 responses is actually VERY LOW! Average is probable 20 to 30! So lets put those figures at just 15 responses per person. Here is what you will make:

at #5 $15.00

at #4 $225.00

at #3 $3,375.00

at #2 $50,625.00

at #1 $759,375.00

When your name is no longer on the list, you just take the latest posting in the newsgroups, and send out another $5.00 to names on the list, putting your name at number 5 again. And start posting again. The thing to remember is that thousands of people all over the world are joining the Internet and reading these articles everyday, JUST LIKE YOU are now!! So can you afford $5.00 and see if it really works?? I think so... People have said, "what if the plan is played out and no one sends you the money? So what! What are the chances of that happening when there are tons of new honest users and new honest people who are joining the Internet and newsgroups everyday and are willing to give it a try? Estimates are at 20,000 to 50,000 new users,

every day, with thousands of those joining the actual Internet.
Remember, play FAIRLY and HONESTLY and this will work. You just have to be honest. Make sure you print this article out RIGHT NOW, also. Try to keep a list of everyone that sends you money and always keep an eye on the newsgroups to make sure everyone is playing fairly.
Remember, HONESTY IS THE BEST POLICY. You don't need to cheat the basic idea to make the money!!
GOOD LUCK to all and please play fairly and reap the huge rewards from this, which is tons of extra CASH. **By the way, if you try to deceive people by posting the messages with your name in the list and not sending the money to the rest of the people already on the list, you will NOT get as much. Someone I talked to knew someone who did that and he only made about $150.00, and that's after seven or eight weeks! Then he sent the 5 $1.00 bills, people added him to their lists, and in 4-5 weeks he had over $10k.
This is the fairest and most honest way I have ever seen to share the wealth of the world without costing anything but our time!!!
Don't listen to the people that don't trust it and continue to say it's
illegal and don't work... They are just too much skeptics.
You also may want to buy mailing and e-mail lists for future dollars.
Please remember to declare your extra income. Thanks once again...

Erm, what does this have to do with me and, even more to the point I
raised, my ex-colleagues who have real jobs in real offices to do, but
do not involve Lightwave (or factory machine control, or weather map
generation, or...) ?

Instead of mere thousands there are countless *millions* of users just
doing an ordinary job of churning out reports and briefing, preparing
and giving presentations, recording expenditure and those kinds of
activities. What good is Lightwave to them?

Meanwhile, as I well know (as their ex-support person who still visits
the old office from time to time) they struggle on gamely and have
learned to cope, however inefficiently or awkwardly: I have a whole
string of real-life tales I could relate; but obviously not here.

However it is *very* satisfying to know I no longer have to deal with,
or even touch, a Wintel machine ever again :))

hehe, yes, playing descent with doom samples ;)
well, the win dosshells don't take care of gus sound output ;)

the solution for future would be sonud output of active window,
maybe faded in, and still some priority levels to let the beep
of another program working get through.

I don't know where people come up with this stuff. SCO does not own
an exclusive right or copyright to Bell Unix. Companies get non-exclusive
licenses to the source for Bell or Berkeley Unix and implemented systems
that they in turn own and sell. There are lots of unix versions on t
the market, both freeware and forsale, and many of them licensed
either the Bell or Berkeley source for hte kernel and/or the system
commands or othe facilities, but there is no sense in which SCO owns
Unix.

In the future, support for threads is going to play an increasingly
important role. systems based on Mach, like NT and OSF/1 are poised
to do well in this arena, as are OS/2 and Solaris 2. It remains to
be seen what will happen to the other players.

Not really. Code tends to cache well because most execution time tends to be taken up in cachable loops. As long as the data fields are the same width the data bandwidth would be about the same for RISC and CISC (maybe even slightly lower for RISC due to better use of registers) so overall bus usage isn't all that different. I suppose RISC processors might benefit from slightly bigger instruction caches.

And while many RISC designs do produce a significantly higher code size this isn't always the case. For example an ARM implementation of a routine is very often no bigger (or only slightly bigger) than the equivalent 386 implementation because although every instruction is 32 bits, you tend to need fewer instructions on average to solve the problem.

As commented elsewhere in the thread, Lemmings and Oh No more Lemmings
was made to work in the Desktop, didn't Krisalis work out a protocol
for sounds to co-exist with each other?

ISTR that they were willing to let anyone have this for free, guess
thats gone to pot now, since Krisalis left the market.

Your anti-M$ bias is outweighing your connection to reality. M$ is the center of the mainstream PC industry.

The model is one of interoping around an OS, like all other computer systems, including OS2, the Mac, NeXT, Sun, HP, AIX, etc.

The big difference is that M$ is the only model where the all other components, hardware and software, than the OS can come from other suppliers. Intense competition characterizes hardware, including CPUs, motherboards and their chips, hard drives, and other such components.

For instance, the PC CD-ROM market itself is intensely competitive with a number of vendors offering products. When I bought my PC, I had a research section on each hardware component. I recently added 32 Mb of RAM for $150 at a computer show where a number of resellers offered the trade-in of old RAM (they tested it with a little machine).

The commoditization of hardware, as well as software, is the great fear of the enterprise server/DB market. The splintering of Unix has given added value to the individual Unix vendors. These vertically intergrated companies selling lines of proprietary hardware and software are direly threatened by the technological spread of the PC industry into their markets.

The response has been to say the enterprise is "locked into" mainstream, Win32 PC industry based solutions. The promise of Java and NCs, of course, is offered to give a grain of truth to these projections.

More likely, Java, the internet, and the componentization of software will speed the takeover of the enterprise by the PC industry. Capitalization, when applied to computers, is primarily the application of computerization to labor to increase productivity. Remember when Wang word processors cost so much but were affordable for high priced secretaries, etc, only to be replaced by the general purpose computer. The same thing is happening to servers, as has happening to minicomputers.

The computer is going to do some much more in terms of ease-of-use, including programming and administration by the average user on networks. This trend will most likely exploited by the PC industry than the Unix culture.

Consider the revolution in programming that modern applications have wrought. Before Visical, programmers had to code each iteration of a spreadsheet that the casual user does today. Such is happening to the creation of apps today. This is not something we can expect from the Unix culture. They will be relegated to the dedicated high end markets where they can be afforded.

Today practically everyone but Sun develops products for the Win32 platform. M$ just released its Commerce Server for $5000 replacing $60,000 Unix systems.

John

Uh-oh, sounds like product dumping. The same type of dumping which is
killing Netscape. The same kind of dumping what made Windows 3.0 the de
facto OS.

When will Mircosoft learn how to play fair? Gates and co. are merely a
bunch of big bullies taking advantage of their position.

At this point, I wish Microsoft's people would cash in their stock and
retire. They're not making decent operating systems, let alone end-user
software.
```

Why did you do that?
win 3.1 will run fine on a 80286 with enough memory (in standered mode)
win 3.1.1 requires a 386 tho...

Blair Davis

BTW, What is all this hassel over different systems? Each system has it's
advantges for different things. I have 486's, atari 8-bits & st's,
amiga2000, c-64/128, mac II lc, ti's, old S-100 z80/8080 based systems.

why do we need to fight over this?

also, I am not rich. I have collected my hardware thru swaps and even in
the trash.

When comparing RISC and CISC, why don't you use a real CISC processor?
It was told, that the NS32032 architecture had the smalest code size
among the available processors that time. The benefit of these real
CISC processors is, that assembly language programming is like C
programming. The functionality available is almost the same. :-)

E-Mail Your Way To Riches!

Dear Friend,

We all know E-mail is here to stay. It's fun, easy and exciting! Would you be interested if we could show you a way to make well over $1,000 per week doing it?

This is not a joke. You may have seen many people trying to tell you that you can make money by joining this or that scheme! Guess what, you decide to go for it and then you get nothing but frustration and disappointment! We are here to take your frustration and disappointment into an Electrifying Adventure!

We have been marketing on-line for almost 2 years now! We have never spent one red penny on advertising and made nothing but profits. We can show you how to make money every day of the year. Many people may think this is untrue or it just can't be done. We are here to tell you that it is absolutely not true. The biggest mistake people make about marketing on-line is that they sit and wait for people to contact them. You will never make it if this is your approach and we'll tell you why. There are over 60 MILLION people on-line right now, and seven new people logging on every minute of the day world-wide and everyone is offering something. So how do you get a potential client or a new customer before your competition does? The answer is simply " Creative E-mailing" and it WORKS! I'll tell you why. You're taking your product, service or idea directly to the market instead of waiting for the market to come to you!

Here are a few testimonials we'd like to share with you (They're all 100% TRUE!):

Internet Communications, my wife and I owe you so much. We ordered your Creative E-mail System and within the first week we received over $1,150 in orders for my Internet Consulting business!
--Charles -- California

I have bought two so-called E-mail programs that cost me over $600.00 when I received them. They were extremely difficult to operate and it took me about two weeks to figure them out. Once I did, they were so time consuming it just wasn't worth my time. When I received your course it took me about four minutes to install and I was in business! Within the first 24 hours of my first E-mailing I received over $580.00 in sales over the phone. That first week I grossed over $2,000.00! I really can't believe how easy you made this, anyone can do it! Thanks!
--Dennis -- Illinios

Hello, I'm a divorced mother of two children. I wanted to thank you for helping me out. This was my first time buying anything on the Internet. I was skeptical at first but I figured I'd take a chance. This was the best chance I've ever took! My part-time business is now a full-time home-business, thanks to your

Creative E-mail System. I had to hire my two family members to help me out!
This is GREAT, thanks so much! I'd recommend this for anyone!
--Ellen -- Florida

You may have seen other people offering products "E-mail Programs, E-mail Addresses, Extractors, Etc." The vast majority of these products are very over-priced and very difficult to even use. None of them even supply you with current, up-to-date, FRESH & RESPONSIVE E-mail addresses! Our Creative E-mail System puts everything into one package to make your profits soar immediately! Even if you do not have a product or service to offer, we are going to give you over 500 how-to reports that you will have full reprint rights to! What makes our course different from anything else being offered anywhere is that we're dedicated to your success! We do not succeed unless you succeed! All of our E-mail Address Databases are created in house. We do not trade our databases with anyone because people are selling extremely bad lists on the Internet. Many of other people's databases are filled with duplicate addresses and many of them are undeliverable. We keep our own database so we know exactly what we have and we keep nothing but the best. There's no other way. We believe in producing high quality products that should be priced reasonably for your success! Read on to see the special bonuses you will receive.

******** SPECIAL 10 DAY BONUS ********

If you order within the next 10 days we will include:

1) 500 How-To Reports (You may resell these at any price)

2) Your Personal Complete Guide To The Internet -- This 175 page e-book covers every single aspect of the internet. You will never have to buy another internet book! When you complete this book, you will know more about the internet than 90% of the people online right now.

3) When you purchase our 8 MILLION SUPER responsive E-mail list we will include Mega-Mailer. It sends 250,000 E-mails per hour! All other orders will receive Pegasus Mail. It mails about 30,000 per hour.

Here's how to get the Creative E-Mail System:

All orders are delivered on CD-ROM or 100mb Zip Disk (Iomega).

============> E-Mail Databases <================

2 Million FRESH E-mail Addresses only $ 99.95
4 Million FRESH E-mail Addresses only $179.95
6 Million FRESH E-mail Addresses only $249.95
8 Million FRESH E-mail Addresses only $299.95

You will be sending your Marketing Letter to 2, 4, 6 or 8 MILLION People! To mail to 2 MILLION People by U.S. Mail at $.32 per stamp would cost $640,000.00, not including envelopes or paper! The price of 2 MILLION E-mail Addresses isn't even a fraction of the cost. And the great thing is that if you have 10 products, you can E-mail to your list as many times as you want to! Your profits will never stop soaring! Don't pay someone else to send your

advertisement out, do it yourself and save big money! The average cost right now to send your ad one time to ONE MILLION people is $1,400.00. You can send it 100 times to EIGHT MILLION people for only $299.95 and that includes Mega-Mailer that sends 250,000 per hour!

I have an old 1040 ST with a black and white monitor, a whopping 20 megs of hard disc storage and a Cannon BJ 100 printer that I would like to sell. The computer would make a good doorstop or prop up for a table wihth a short leg and the hard drive is big enough for a corner stone in a modern repliction of a Gothic Cathedral...:)

If you, or any one know has an undying loyalty to Atari... email me and make an offer.

Thanks,
AndB.

```
: the solution for future would be sonud output of active window,
: maybe faded in, and still some priority levels to let the beep
: of another program working get through.

When I was working on the game PowerCrystal (large scale adventure game in
3D for Win95 and the not yet released M2 console
(http://thor.lib.chalmers.se/~jamest/power_crystal for anyone interested))
we used DirectX on the windows side which you could set up to do exactly
that.

It seemed to be a nice system at first, but after a while I found it to be
a bit hard to work with as it seems to be aimed a bit too much towards the
C++ people which is not really what we wanted as we where coding the game
in C.

I had it running together with a couple of other games and it switched the
sound between them as input focus changed. One of the other games I ha
drunning at the same time (to really load the machine when testing) was the
Creatures game (http://cyberlife.co.uk) and it did work quite nice even
though it sometimes reported the hardware terribly wrong and did some very
time consuming stuff if you wherent very careful about how you handeled it.

The idea was very nice though, I hope it will develop in the future.

You want complex? Check out the VAX's instruction set sometime. printf() in microcode, no less.

The point of RISC is that the vast bulk of code is generated by compilers, which didn't (at the time RISC was new) use the tricky instructions much. So they were left out, the silicon got simpler and hence faster. RISC also traded some code size for standard instruction word length to make caching, pipelining and branch prediction simpler and hence faster.

Source record: 6150
Cross-posted to: alt.atari.2600,alt.atari.2600.vcs,comp.sys.atari.8bit,comp.sys.atari.advocacy,rec.games.video.atari

I'm looking for a few volunteers/guests to be with me when I shoot in the SF Bay area for about 1-5 days in early June. Video experience a plus, but not vital. No need to commit for the whole shoot, you can just stop by if you like.

I'm essentially making this offer to allow some of the more ravenous Atari fans a chance to meet some of the most famous names in Atari history. People like Al Alcorn, Joe Decuir, Warren Robinett, Doug Neubauer, Rob Fullop, and more. Mostly 2600-related, but some 8-bit talk.

I don't want to turn it into an outright convention, but I do think it would be nice to let some people meet their "idols" so to speak, and if you want to assist in the interviewing, I could use the help.

Please e-mail me if you want to attend and spread the word at your user group meetings...

Glenn Saunders

I need Software developers who can program highly advanced graphic programs.
The Software needs to run on Unix Workstations and Windows NT/95 environment.

It is not a one person project. You will be working with multiple people.
So you have to know(or learn fast) how to work in a team.
It doesn't matter were you live. 'Cause we can have contact through the Internet.

If you think you can do this, PLease ReMail this message and tell me something
about yourself and your work(not neccesary). And I will send you some more information.

Sincerely

Ruben Daniels

The CAD industry is a very delicate industry.
Everything has to be precies sometimes as precise as a 10th or 1/100 of a mm.
This is iin some case impossible to do with a computer cad program.

Companies that have these problems for instance people in the designing industry have to make everything perfect.
For them is it impossible and much to time costly to use a computer fo this purpose.

Well I have got the best thing for you.

It is an machine developed in Denmark.
There is still only one prototype of it.
It is a laser wich can scan any object and make it into a dxf format file.

Of course you can see that this machine has unlimited possiblities to use it.

We offer now, 'cause we still have to refine and test it, a free use of the machine.
The only thing you have to pay are the transportation of the object you want to scan to send to Denmark.

It has an accuracy of about 1/10 mm but if the machine is ajusted just right it cen be even more accurate.
In the future we expect it to be as accurate as 1/100 of a mm.

Of course the objects cannot be very large. If they are they must scanned in a couple of times.
Of course this is no problem.

It can save tens of thousands of dollars because else someone had to make it with the computer which is impossible to do with a precision of a 10th mm.

The speed of this machine is incredible of course you can control this but it can be done in 5 minutes. Of course the scan will be better if you let it take more time to scan.

Please remail this message for more information. Please tell me what kind of object you want to use it with etc. If you want to make use of the testing we will bring you in contact with the developer of the 3D laser.

When you remail lthis message please answer the following questions.

Thank you

- If this machine was brought to the market what would you be willing to pay for it?

$10.000 - $20.000
$20.000 - $30.000
$30.000 - $40.000
$40.000 - $50.000
Another value please type it yourself

- What would you use it for and what do you think it can be used for?

- Do you know people who could use this product? (Do you want us to contact them)

Sincerely

Ruben Daniels

What is a 500ST? :)

Mike

Falcon user (no, not the PC game:)

Lurk in comp.sys.atari.st and watch for the term Falcon to come up:).

913. Falcon and software for sale - GREAT BARGAIN!

Newsgroup: comp.sys.atari.advocacy
Date: 1997-05-11 00:00:00 UTC
From: brmiller@tiac.net
Message-ID: <3376526D.CE20D389@tiac.net>
Source record: 6162
Cross-posted to: comp.sys.atari.advocacy,comp.sys.atari.st

Yep, folks, I've been a TOS user for well nigh ten years now, but it's finally time to sell the ol' Falcon (which was a fantastic machine for my media business from 1994 to 1996!)

So, I've decided to price it low so someone else can get as much fun and use out of it as I did.&#65533; The following is the listing of what I have for sale, and how much it will cost ya (note - add in the shipping fee and COD fee):

One Atari Falcon 030 4/0 - Yep, this is the good ol' stock Falcy we all know and love.&#65533; It comes with keyboard, mouse, and all the other myriad ports and software that Atari included (GDOS, language disk, etc.), including MultiTOS and AtariWorks.&#65533; I'll also throw in Geneva, the fast multitasking environment with customizable appearance.&#65533; Most manuals are included, as are original disks.&#65533; If you REALLY have to have it, I can throw in the original box, too (though it would take longer to get to you that way).&#65533; Asking $400 OBO.

One 500 megabyte hard disk with Falcon cable - it's got a ton of shareware, registered and unregistered, as well as HD-installed versions of the Geneva multitasking OS and AtariWorks (both of which I'll keep on there if you buy the computer, since you'd have the legal copies already.&#65533; Otherwise, they won't be on there).&#65533; In particular, there's a wonderful working Internet setup, with CAB, STiK, Newsie, MGFTP, and a number of other goodies, all waiting to go!&#65533; And if you decide to go for the whole bundle, all the commercial apps below will be on it already (plug and go computing!)&#65533; Asking $150 OBO.

One copy of Calamus SL - the wonderful modular DTP package.&#65533; Includes all the base modules plus raster objects, vector objects, and a few extra fonts from a DMC upgrade deal.&#65533; Everything you need to do top-quality desktop publishing work.&#65533; All manuals and disks included.&#65533; Asking $75 OBO.

One copy of Envision Elite - a great bitmap editor, with lots of powerful functions.&#65533; Sort of a "mini-Photoshop," without the filter plug-ins, this program allows full editing in color and has a number of powerful brush and tool functions.&#65533; All manuals and disks included.&#65533; Asking $25 OBO.

One copy of Papyrus 3 - WOW!&#65533; What a WP!&#65533; This document processor includes EVERYTHING you need to get started and keep going,

including full GDOS and SpeedoGDOS support, a powerful spell-checker, and layout options that make it a formidable challenger to word processors like WordPerfect for Macintosh!&#65533; All manuals and disks are included.&#65533; Asking $75 OBO.

One MiGraph COLORBURST 16-bit color hand scanner - WOW again!&#65533; This hand-scanner from Migraph works with the Falcon only, and allows true-color scans of just about everything!&#65533; Includes all manuals and disks, as well as interface cable.&#65533; Falcon only, asking $150 OBO.

One Supra 14.4 FAX Modem with cables - nice for browsing the web with.&#65533; Works great with STiK and CAB/Newsie/Oasis, etc.&#65533; Asking $50 OBO.

So. . . the total system, as priced above, with everything, is $925!&#65533; Buy everything together, and I'll sell it for only $825 OBO!&#65533; All you need to do is add an Atari monitor or VGA monitor (with appropriate adaptor), and you'll cruise into high-speed TOS computing without a hitch!

If you're interested, please e-mail me at brmiller@tiac.net, and we'll talk!&#65533; I'll verify that everything's in working order before I send it out to you, so if there are any problems, they'll be caught.&#65533; Finally, unfortunately, I have to insist that all transactions be conducted COD, with the buyer paying the COD and shipping costs.&#65533; I am only doing this because an unscrupulous individual stole my 1040ST from me by writing me a bogus check.

Thanks for your time!

914. Infusion BBS Software

Newsgroup: comp.sys.atari.advocacy

I just thought I'd let everyone know....

There is finally a BBS Software with all of the great features of OBV/2 and Iniquity, but without the bugs and bad
support. Infusion BBS Software is a new generation in BBS Software, modeled after OBV/2 and Iniquity with everything
that the sysop can imagine..and more.

Some basic features are:

o Multi-node upto 255 concurrent users
o Light-bar support [arrow keys]
o Requires NO Fossil Driver [selectable FOSSIL, ASYNC, and Digiboard for each node]
o Online Configuration [menu editor, string editor, evemt editor, node editor, system editor, etc]
o Pipe Color Codes
o MCI Codes
o Powerful scripting language
o Internal One-Liners, Blacklist, voting booth, etc
o Internal Z-Modem, X-Modem, Y-Modem, Y-modem-g [no limit to external protocols]
o Internal COMM Program with internal protocols, Auto Up/DL
o Great support
o Basically all of the great features of OBV/2 and Iniquity combined

Infusion has been picked up by fuEl [international art group], and Infusion 1.0th will be released June 10th.

Come to the Infusion Home-Page at http://web.wt.net/~sparky/ibbs/ and jump into the JAVA Based Chatroom,
or come to the ANNEX, the official Infusion IRC Server [irc.annex.net] #infusion / #bbs

send the author skaboy101 [Grant Passmore] E-mail at skaboy@usa.net

Hello, everyone:

The Falcon, hard drive, and scanner I was selling are now sold!
Here's what remains of my esteemed inventory:

One copy of Calamus SL - the wonderful modular DTP package.
Includes all the base modules plus raster objects, vector objects,
and a few extra fonts from a DMC upgrade deal. Everything you need

to do top-quality desktop publishing work. All manuals and disks
included. Asking $75 OBO.

One copy of Envision Elite - a great bitmap editor, with lots of
powerful functions. Sort of a "mini-Photoshop," without the filter

plug-ins, this program allows full editing in color and has a
number of powerful brush and tool functions. All manuals and disks

included. Asking $25 OBO.

One copy of Papyrus 3 - WOW! What a WP! This document processor
includes EVERYTHING you need to get started and keep going,
including full GDOS and SpeedoGDOS support, a powerful
spell-checker, and layout options that make it a formidable
challenger to word processors like WordPerfect for Macintosh! All
manuals and disks are included. Asking $75 OBO.

One Supra 14.4 modem with cables - great for web browsing. Asking
$50 OBO.

If you're interested, please e-mail me at brmiller@tiac.net. The
remaining stuff clocks in at $225, but buy it all together, and I'll let
you have it for just $200 (plus S/H and COD costs).

Thanks!

brmiller@tiac.net

I present here my two most recent software which I hope they interest you.
they are progammed by Turbo C++ and run under Windows(3.11 and 95).
here is a short description of these two software.

1-Robot Spy 1.0
at my knowledge, this software is the first and the unique of its kind.
This software allow you to spy your friends who are on the net at the same time
of you, it permits to see exactly what they do on their screen, pixel by pixel,
anywhere, in the world, at the condition they are connected to the internet.
how does-it work?
it's simple, you send a file to the person you want to spy telling to him it's a
game or everythings else, the objectif is this person run the file. from this time,
a batch file is installed on his computor, and everytime this person use internet,
this batch connects him secretly on our server.
on your side, you , after the installation of the other part of the software every time
you want, you can connect on our server with your password and have the list of all the
persons who received your batch and who are connected at this time.
the only thing you have to do is to click on the name of the person you want to spy.
a window opens containing exactly the screen of the person spied, you can have
ten pictures per second with 256 colors, if you switch to balck and white mode you can
onbtain a real time sequence, approximatly 30 pictures by second.

Robot Mailer 1.1
The message you are reading presently is sent to more then 20,000 newsgroups with
this software. This program automates FreeAgent, and reach with a connection of 28,8 Kbauds
5,000 news per hours. It can also find a maximum of 50,000 e-mail adresses from internet
and
send a message in 4 or 5 hours. You can obtain with this sofware the most powerful tool of
mass transmittion on the internet.

Robot Spy 1.0.................20 US$
Robot Mailer 1.1.............20 US$
Both.............................30 US$

I'm sorry i can't accept credit card, but you can send an international money order to:

Ben Hedi Nassef
1481 Ste-Catherine est #7
Montreal, PQ, H2L-2H9
Canada

Don't forget to include your e-mail on a paper, you receice the software ordered in your
e-mail the day we receive the money order.

Geez--I _have_ an Atari 520ST, with the single-sided 720K drive and 512KB of memory and an 8 MHz 68000 CPU. It's great for playing Chaos Strikes Back (since FTL for some reason went out of business before it ported CSB to the PC, and I'm tired of playing Dungeon Master), but other than that, my old 12 MHz 80286 beat the pants off it in every other category. Way back in ancient days (1988 or so), Byte ran a comparison of the Motorola CPUs vs. Intel, and the 68000 at 8 MHz was equivalent to a 4 MHz 286 (if there were one that slow)... And you're comparing it to a Pentium?? Whatever you've been smoking, it's clearly toxic to brain cells <g>...

BTW, this is not just my lowly opinion. I showed your post to a couple of former rabid Atari users (who had thousands invested in their multiple 1040ST systems), and they agree. While we remember the Atari with fondness, it was by no means fast at anything, except in comparison to a 4.77 MHz 8088 machine. Let's not lose all resemblence to reality here...

The operative word here is 'large'.

Yes, but considering that it includes four major applications, it's
not that large. If you have a 280MB drive, it's LARGE. If you have a
2 GB drive, it's not so large. If you have a 3.8 GB drive, you hardly
need to worry.

I don't believe I ever compared CPU's. I compared RAM.

With 4M and Laser C, admittedly an austere enviroment, I outran
any PPro200 using whatever development tools were available.

It's all simply a matter of engineering and building solutions that
fit in the hardware constrants given.

NOT doing that is what turns these barn burners into sloths 10 times,
or more, slower than they should be.

Got to agree with Hugo here - whilst the Amiga custom chips were once well ahead of the field in terms of the video and sound they could handle, they are now completely outclassed.

My guess is that since it should now be possible to put all the Amiga custom chipset together with a 68K compatible processor core on a single ASIC, and since the AmigaOS has such a nice small memory footprint it could make quite a capable competitor to such things as the home NC and WebTV.

Of course this was also the market that VisCorp wanted the Amiga for - the difference with Gateway is that they have the investment capital and

marketing clout to make it work. Whether they have the technical design skill to produce a good product at the right price point is another matter. If they do, then the Amiga could start causing problems for Acorn once again.....

Chris.

I think the "Idiots" are the ones who have been cross posting Mac and
PC bullshit into this newsgroup for the last four or five months.
The reality of it is, in c.s.a.st, the people are helping eachother
with a platform they enjoy. In every thread from the cross post here
lately, are blind stupid comments on eachothers operating system. 90%
of you don't know what the fuck your talking about. Mac users
are trying to keep their idenity and dream of a Mac perfect world,
and the PC users are Gates clones with sticks up thier ass. If you
were real computer users, you would go purchase a good RISC UNIX box
and perform some sort of useful function. I'm glad not to be part of
the PC clone world, and while Macs are pretty to look at, I don't want
to stand in a river of software that is constantly changing directions.

I disagree. You start downloading Netscape, get a hankering to play
marathon infinity, and what happens? Your file transfer flails. I want
to be able to play marathon and not have my file transfer
flail!!!!!!!!!!!!!!!!!!

First, running Word or Excel at the same time as Marathon or Doom or ANY
game is easy, and worthless. Neither word or excel use the CPU during
idle time, thus there is no multitasting going on. As far as Netscape and
Marathon, this has nothing to do with the system really, Bungie made
Marathon so that when it loads it disables the system and multitasking.
Marathon locks out everything so it gets max CPU time. A bad multitasking
system or not, nothing else moves while Marathon is running. Try this,
after starting your download, and loading marathon, hit command-shift-5
(*I THINK*) Not sure about that, but there is some key command the
re-enables multitasking. This should allow your download to go on.
However there is a performance hit, and again, not sure about the key
command. Check the marathon news group for that.

I can't help but feel that a lot of games multitasking is basically
multitasking for multitasking's sake. I mean, a lot of fuss is given to
"wow, we can run Doom at the same time as Word and Excel" or something
like that (under Win95, not RISCOS) but how many people actually DO
this? I for one play games OR do serious stuff. Never do I do both at
the same time. Perhaps during that coffee break, but I'd be loathe to
leaving Windows apps running alongside a game like Doom or Quake.

Tim.

I tend to play games quite a bit under Warp while doing large FTP xfers
and other things. Not a daily occurrence, but I'd guess I'm doing that
at least 3 times a month.

I also tend to get lazy and leave things open all over the place -- as
long as the OS allows me to do that, it isn't a problem. Why close a
program I might want to get back to when it's not impacting me?

If I want to run GUI apps just one at a time, I can just use an Atari ST.
Even on the lowly ST, I was doing background xfers while running other
things. Most computers are expensive. Letting them sit mostly idle
because your OS is unsophisticated is quite silly.

>

If one is foolish enough to start a Netscape download, it's nice
to know that the entire machine isn't crippled for the duration...

Like in two windows? On Linux or what? Win and OS2 don't have
enough vid speed in the GUI. In Linux there's almost no
difference between the console and the GUI. (Preen)

Well, not apps, but it's nice to be able to keep file and print
sharing going on for other people if a group of us are Descenting.

As far as home machines go, I think multitasking in the GUI is just
totally overated. Who uses it? It's just confusing to a newbie; he
does one thing at a time. Only real geeks really use their GUI. And
a lot of apps nowadays just ditch the standard Windows or 95 or
OS2 look and feel and do their own suped-up mega-resource-intensive
multimedia thing. Which is cool with me, cause Linux and X and
whatever-win-manager-you-use doesn't have a standard look and feel
like Motif or CDE. Linux apps use different things, motif
statically linked, or athena, or tcl/tk whatever. People use the
apps, not the OS.

Supposing we DIDN'T have a particular near-universal (but
sinfully proprietary) look and feel. Did we all want that,
or just a binary compatibility standard? (If we did just
want that, at what cost did we get it (with MS), and did we
really get it at all?)

Heh, it's not so long ago that people were deriding the Mac for having bitmapped graphics for graphics sake, or sampled sound for sound sake. It took a long time for them to be persuaded that graphics and sound were more than just useless toys, and could make computers easier to use and so increase productivity. Now all modern computers have hi-res colour bitmapped graphics and 16 bit stereo sound input and output, and no-one questions the benefit of these capabilties.

So with game multitasking: right now machines need all their horsepower to drive Quake at a maximum fram rate, and people have got used to disabling other apps when playing graphically intensive games. But very soon this won't be necesary: with 3D accelerators taking care of graphics processing even today's computers don't need to spend all there time running a game, and with processor and other computer technology improving dramatically pretty soon even your basic non-3D-accelerated PC will be able to run Quake well utilising less than half of it's processing power. Apple demoed Quake running in a window on Rhapsody alongside 2 QuickTime movies, all running at close to 30 FPS, on current hardware with pre-Alpha release of Rhapsody (their next-gen OS), at their WWDC.

Will anyone use this ? Sure. I doubt I'll ever want to play Quake and word process at the same time. But it'd be very useful if I could run Quake without disabling my fax and voicemail software, so the computer could keep on monitoring the phone as I played, or as it monitored e-mail and alerted me of any urgent messages, or downloaded files in the background, or compiled and linked a large project. Or whatever. Very soon probably most games will support multitasking in a window alongside other apps, and people will think nothing of using a game alongside another app, much as they think nothing now of full-screen, 30fps rendered 3D games.

John

It's a well-established fact that task switching (as opposed to true
multitasking) is adequate for most people all the time, and the rest of the
people most of the time. However, I do like to bring up a game or do some
real work while long net data transfers are happening. I guess that counts.

I have not noticed any degradation in Quake (DOS or Windows) while other
apps are open and quiet, although W95 works harder to free up the physical
memory needed to start it if there's a lot running.

Word 2 used to bog screensavers down badly, so I'd say it was using CPU.
I've also been told that Windows apps must process certain global event
messages even when "quiet", leading to some slowdown. Can't say I notice it
but.

DOS Quake doesn't block winsock TCP/IP transfers, although the packet
response can lag a little (P120 system). W95 Quake is better again.

You're a little behind (smirk?). WinQuake's frame rate is barely
behind DOS Quake's at the same rez,and depth in a window,
and just as fast full-screen; it will quickly move ahead of DOS
now that DOS evelopment has stopped. Translation to 16 or 24-bit
depth on the fly still hurts, but it works fine.

: because your OS is unsophisticated is quite silly.

And let's not forget, since this is (amongst others) Atari advocacy,
that you *can* run multiple GUI apps on an ST at a time.
It's a kind of MagiC...

Now, the thing about games multitasking is that the OS makers mainly use
it to demonstrate how good their OS can multitask apps that aren't made
for multitasking. There's no use that I could think of for running
Doom and Excel at a time. Nothing to say against a quick dash of Tetris
while downloading, or even Doom while downloading... but of an app that
calculates something, I'd expect to calculate it fast enough for me
not to *want* to run Doom in the meantime.

Needless to say, this is where all your over-bloated Windows apps fail.
This is not a fault of Windows, mind you. The trouble is that such
featureism (as being able to run Doom and Excel alongside) is being made
to run on such an instable and unsophisticated kernel.

If I'd want featureism, I'd want it on a stable basis. If I can't havem
or can't afford both, I'll take the stability.

Yours,
Erik.

The only REAL multitasking things I would like to do is to download
files while I am playing games. Win95 can do that to some degree,
although not great. However, I am not given up any win95 games because
of that.

Jedi, I'm confused. What kind of system
1) is limited to "run GUI apps just one at a time"; and
2) is crippled for the duration of a Netscape download?

Surely no computer these days fits this description....maybe a Macintosh Plus circa 1986 with MultiFinder shut off, but Netscape doesn't even run on that system. I thought every supported platform's version of Netscape

did background downloads -- what system are you referring to? What system can only run one GUI program at a time?

Are you talking about PDAs?

Want to see something really amusing? Try running GCC in the background
on a Linux/X system and then run, say, doom or whatever.
Now try the same with W95 on the same system. I compiled a small program
in the background using DJGPP on a P75 with 8 Mb RAM. When I tried switching
back to Windows, it took the damn thing almost ten seconds just to draw the
start menu :) I haven't even _tried_ to launch Word.
While compiling a large package using GCC in a Linux environment will
ofcouse slow down the system a bit, it's still fast enough to at least do
something else. Like playing doom :) Don't run Netscape though... It will
eat up all of your memory and then crash :(

Anything running MacOS, Windows 3.1 or Windows 95 fits this description fairly well, especially in the context to which I was replying.

For those of us who would prefer to not merely use our computers as doorstops, nothing short of NT will cut it. Those other OSes don't offer anything to offset their inherent unreliability.

Action games degrade if they don't get 100% CPU attention, and the protocol stack running to download your file does need some CPU attention itself. It's not fair to expect this to be perfectly smooth. If you were running Word etc you probably wouldn't notice the degradation.

That said, the degradation caused by PPP and TCP/IP at 28.8 while playing games on my P120 is very slight.

It is handy sometimes - like when you're doing a long download.
That's the one thing I don't like about Linux - I can't play Civ2
while waiting for a download to complete.

Time to get on with cloning Civ2, methinks. :-)

Bullshit, JEDI, Bullshit. MacOS drives serial port servicing from interrupt routines; I can detect no impact of a background modem download on foreground tasks.

Calling ones opinion well established fact is probably a little
dangerous, but I would agree with this part of the comment, that most
people don't think they care, otherwise Windows3.x (and even 95), and
MacOs wouldn't be so popular.

>and the rest of the people most of the time.

As one of the 'rest of the people', I can say you are wrong here. I
care a lot nearly all of the time, and get really quite frustrated
with a system when I can't move a window in a co-operative system
simply because disk access is going on, or when the same thing happens
under a pre-emptive system with a broken UI design, like a certain
popular operating system I could mention. I care a lot.

One of the earlier versions of Netscape I had (16 bit?) busy-looped
during downloads, but it wasn't even noticeable unless I had a cpu meter
running. I have 3.02 Gold now, and it uses near nil cpu for downloads.

I've never seen it cripple the machine; unless I see the download
Window, I don't even know it's happening.

Under Linux GCC is a native app, whereas under W95 I presume it's an
extended DOS app. If it were ported to the Win32 console I think you'd see
much better multi-tasking performance; the overheads of task-switching
to/from DOS boxes are probably high.

At any rate, you would have to check that GCC was slowed down equally by
Doom on both OSes to show that W95's task switching is poor. DOS boxes may
simply get more than their fair share of the CPU under W95.

I read an article once about the results of various studies into the way a range of real users interact with their PCs. This was a major point of consensus among them. If if was purely my opinion you would see "IMHO" in front.

That has nothing to do with it. Netscape is a greedy little bugger
that acts like it's the only process in the system.

This is fine for NT and 'nixes as they have the facilities to deal
with such "malicious" programs.

Hmm...I strongly feel that my Atari systems are just as useful today as when
I first bought them. (and I'm still buying them!) I have a Mega 4 ST that runs
my BBS, an STe that my son plays games on, as well as education programs (He
adores Tony Barkers "Art For Kids"), a Jaguar for next generation gaming, a
Lynx for gaming on the go, and (of course) my Falcon for my "serious" needs.
<smile> I operate these systems at far less cost/system resource demands/and
maintenance than anything the Wintel conglomeration (abomination!) can field.

>Because computers are about getting answers to problems, not about making
>political statements.

Exactly, and thats why I choose to follow the Fuji... Long may her banner
wave! Oh, BTW, being able to make "political statements" at the same time
as using my Atari's is just an added convenience...! :^)

True. I have upgraded to a 200MMX and probably will make it a lot
better. Another thing is that when win95 is using virtual memory,
things get really bogs down. It is particularly true when I am running
Magic the Gathering (not an action game). On my old machine (p100 with
16 meg), I have to close everything just to save on swapping time. Now
(P200mmx with 32 meg), I probably can multitask a bit.

>Goodwill staff going to be there? :-)

Don't laugh! I bought a working 1040STF with a few disks and color monitor for $20 (half-price day) at the local Goodwill today. (Stat holiday - Victoria Day in Canada)

A while back, one without monitor & disks was snapped up for $40, but this one had been lying around for at least 3 days. I thought I'd buy it before some kid stepped on the boot disk. It is, however, missing a mouse.

A while before that, I had the great good fortune of buying an Amiga 1000 for $40...so I now have some more antiques for my collection. I think I can use a standard Atari-style joystick in the mouse port (I have two I bought for my C-64) of the ST. The Amiga's mouse had no rubber ball - I used one from a (dead!) Mac ($15, another thrift shop).

My C-64, on the other hand, was a Christmas present, bought at full price when they were new. It served for several years as my computer; I wrote several programs for it, including some with machine language routines to speed them up. And I bought quite a few games for it as well. It eventually got relegated, once I bought an XT clone - whose motherboard got upgraded (right now, I'm using a Pentium Overdrive on a 486 motherboard...).

Back before there were IBM clones, I wanted to go to 16 bits without spending a fortune, so I considered something more independent. The Mac wasn't an option - it was expensive, and I was content without a GUI. It seemed that Apple was behaving just like IBM: charging premium prices for hardware because of the software available for it. So I considered the Atari ST, and even, later, the Amiga 500. The local Amiga group met out of town, so I joined the local Atari group for a year to learn about the computer...but I wound up buying my cheap XT clone. Today, the situation is different, in that hardware prices aren't the issue, but the Windows/Intel 386 architecture standard is just too strong. I plan to give my hard disk a housecleaning, so that I can again strike a modest blow for independence by reinstalling Linux on it...

but I just don't see any *reasonable* alternatives to Wintel. Alternatives I can recommend to my friends - and feel that I've been conscientious in respecting *their* interests, not just my opinions.

Because computers are about getting answers to problems, not about making political statements.

People interact this way (single-tasking) with computers because they either don't know any better or had they system crash in their faces when they tried it. Most people I know (who use systems with bad multitasking) belong to the latter group. They'd sure would like to do something else while a big download is on the way, while a big file is spooling to the printer, while installing a big program (especially older ones, on many floppies), but their Windows 3.1 systems won't allow it. It's a little better with Win95, but still vastly inferior to other systems such as OS/2, Linux and even NT.

I remember that beside having to reinstall too often, one of the main reason I switched to OS/2 from Windows 3.1 was that just starting Solitaire was enough to hang a 2400 bps download...

The problem I have with this statement is that, as a Mac user, I don't
see *any* of my friends using their computers for anything
substantially different than what I use my Mac for. I have an
Amiga-user friend who's dropped about $1500 into LightWave and
LightWave add-ons for his Amiga...but there's a Mac version of
LightWave, which is quite zippy. And the Amiga is no longer, and
```

hasn't been for some time, the premiere platform for running LightWave. And he's the only one of my friends who's doing different kinds of things with his computer, and these things aren't all that different from what I could do if I spent the same $$$.

For the most part, the Mac works better than a Wintel machine. I met someone at a party this weekend who heard from my girlfriend that I was a computer guru, so he came up and asked me how to get his CD-ROM to work. I asked him if it was a PC, and of course it was, so I explained that I really only work with Macs. His response to the word "Mac" was "The Mac sucks", and my thought at the time was that if he had a Mac, perhaps his CD-ROM would work. This apparently hadn't occurred to him, and I think the encounter highlights a problem the Mac has: there are many people who know very little about it, and more who are outright prejudiced against it. And despite the fact that many are confronted with inferior solutions, they still don't see them as inferior. Despite the fact that you can't get a CD-ROM to work, you still think you're superior to someone who never gave a second thought to a CD-ROM, because it worked from the start, and it continued to work. The PC users' solution is to buy a new computer. The Mac users' solution is to buy a CD-ROM and plug it in. This doesn't make me wonder about the fact that the installed base of Mac computers is much higher than the Mac % of new computers sold.

The main thing when you buy a computer is you should buy one that works the way you want it to that does what you want. As a Mac user for ten years, I've never called a technical support number, because I've always been able to figure out how to get things to work. Getting the machine to work for me, rather than the other way around, is high on my priority list, so it's understandable that I've been a Mac user for ten years. I've also never had problems finding the software that does what I need it to. And, once you get over the common pitfalls, it's a lot easier to program software to solve specialized problems for the Mac than most people realize. The fact that it's a GUI machine makes things a bit harder in some respects, because you have to spend a lot of time on interface details, but a lot of this code is cut&paste once you've built some working code and acquired the right resources. The fact that I can become reasonably proficient with Mac programming with nothing but a high school education in programming and a bachelor's in mathematics indicates, to me, that most people can write code to solve their own problems on a Mac with very little formal CS training. This is nice. The Mac *is* hard to program when starting out, but the learning curve is more friendly with some persistence.

> Because computers are about getting answers to problems, not about making

> political statements.

What problems do you need to solve that make you think the Mac is not a *reasonable* choice? For some people, it isn't. But for most

people, it is. For some people, the Mac is clearly the best choice. Like everything else, there are strengths and weaknesses, but the Mac's weaknesses are surely not so severe that it is not a *reasonable* choice. Unless your friends want to multitask a full-screen realtime first-perspective game with complex Mathematica operations. If that's the case, the Mac isn't a good choice, but neither is anything else--except maybe an SGI, and those are too expensive to be playing games on (unless, of course, you're independently wealthy like some of my friends, and don't have anything better to do than buy cool stuff for the sake of having it and waste it because it's cool--it's nice to be independently wealthy; it just isn't a good representation of ordinary people). The Mac is a good choice if you want to run Mathematica. It is also a good choice if you want to play full-screen realtime first-perspective games; the Marathon Infinity demo impressed me enough that I will probably buy Marathon Infinity, and MacQuake is coming. DukeNukem 3D is out in demo. There are *excellent* graphics tools available for the Mac, in addition to excellent WP's, page-layout, etc. So-so spreadsheets. Excellent web development tools. Excellent internet tools. Excellent programming tools. Excellent scientific and symbolic math tools. Excellent multimedia. And in addition to all this excellent software, the hardware is very nice, and it works like it should; i.e. it doesn't take much brain power or time on the phone figuring out how to get things to work. How is this not a *reasonable* choice?

Too many people have bought into the media lines...everybody wants to read about David and Goliath, and you can buy that at the supermarket stand, and you can get it in Ziff-Davis magazines. These things thrive on tearing things down. The problem with the computer media is that there's only one thing left to tear down: Apple. And if Apple is gone, and Wintel dominates, there won't be any more David and Goliath. It'll be Goliath banging his head on the wall in a padded room. And how much fun is that?

It's so much fun, a lot of the people writing for the computer media would be out of jobs, and there wouldn't be very much interest. Apple is the last major company standing up to Windows and Intel. Think about that. I would also add, it is better than Windows and Intel, in most respects. Not in all. But it is certainly a *reasonable* choice. It is the last *reasonable* choice that can stand up to both.

There are much better solutions than Windows in many limited respects. But Apple is the last remaining company which satisfies the bill in most respects. I myself would prefer to see multiple (>1) solutions which satisfy the bill for "most respects". And guess what? We're down to 2. If one disappears, there won't be "multiple" anymore. And guess what? MS and Intel will get marginally richer. And consumers will get shafted. So, if you want MS and Intel to get richer, go for it. If you want to do cool stuff, it doesn't hurt to support/tolerate a little competition. If there is no competition, nobody will know that things could be better. And that's the problem. There has to be

new stuff driving people to buy things. And a one-supplier economy isn't going to provide that. Things will still improve. But it will be like phones. In the old days, you had to rent a phone. You couldn't buy one. You had to pay exorbitant prices for long-distance. When AT&T was broken up, AT&T became a much more consumer-friendly company. Why? Competition is good. Deal with it.

What is failing in the computer industry has nothing to do with Apple--it has everything to do with consumer-friendly economics, and the fact that this "free" market is failing. The only thing which currently holds MS together is the fact that they can point to Apple as an example that competition exists. If Apple disappears, I suspect that there will be some anti-trust changes to artificially break things up. And which would you rather have? Real competition, or legally dictated, artificial competition?

This is not a political statement. The free market is superior. We should preserve it while it exists. Everything else is just intervention.

Actually, most PC users never have trouble with this kind of thing. Both
my PC systems have perfectly functional CDs that I never give a thought to.
There is a far larger installed base of PCs, with hundreds of manufacturers.
Quality varies. From the Mac systems we have installed here, they seem more
likely to fail than the PC systems. YMMV.

>The Mac users' solution is to buy a CD-ROM and plug it in. This
>doesn't make me wonder about the fact that the installed base of Mac
>computers is much higher than the Mac % of new computers sold.

The problem Apple (and other companies) is one of marketing. They flat
out do not advertise to the mass market. Neither does Digital. This is
their own (questionable) choice.

Competition is good. When I upgraded systems last Jan, I looked at all the
major platforms. I priced Dec, SGI and Wintel machines. I also contacted Apple
via one of their email surveys. Instead of app lists (although most of the apps
I use are no longer or never have been available for the Mac) and performance data
they sent me a brochure telling me how warm and fuzzy people feel about their Macs
and all the web browsing I can do with it. Not how much more work I can do with it.
Please.

Needless to say, I now have an NT4 P6 machine in my office. Works like a charm.

If by `hybrid' you mean `can run CISC and RISC code,' that's the
only one I'm aware of. On the other hand, more and more high-performance
CISC processors appear to have a RISC core. The Pentium Pro, for
example, takes the CISC instructions, translates them into `uops'
(u as in `micro') which have an instruction, two source and a
destination register, and feeds those into a RISC core.

I believe the NX did the same thing, but could also accept those
RISC instructions directly in the instruction stream.

<http://infopad.eecs.berkeley.edu/CIC/archive/cpu_history.html>
has interesting information on this sort of thing.

What if one user will want to do word-processing and another one play
Quake?

>without disabling my fax and voicemail software, so the computer could keep
>on monitoring the phone as I played, or as it monitored e-mail and alerted

Get an operating system! My goodness, what the hell are you using? At best,
Quake can use 100% of the cycles it is given. Except for the memory
requirements, it's not all that different from running and endless loop.

No computer running a decent OS will become unusable when someone runs
a single CPU hogger. You could run quake on a 386 Linux box, and still be able
to use modems, networking and all that jazz. Sure, the game's framerate would
be incredibly pathetic on such a machine, but that's not the point.
The point is that it's shocking that you have to disable your fax and voicemail
software. Doesn't that strike you as odd?

On my computer at home, I could not only run a fax server and quake simultaneously, but
they would execute on separate CPUs if they both needed the processor
at the same time.

>me of any urgent messages, or downloaded files in the background, or
>compiled and linked a large project. Or whatever. Very soon probably most

So get an operating system. I can't believe that in 1997 someone with a
powerful computer hardwarewise is wishing that he could play a little game
while receiving a message or compiling a project.

Do you also not have running water or electricity in your house?

How can you stand using your computer?

>games will support multitasking in a window alongside other apps, and
>people will think nothing of using a game alongside another app, much as
>they think nothing now of full-screen, 30fps rendered 3D games.

I've been running multiplayer UNIX arcade games in a window along side other
apps for years. Things like xtrek, xpilots and more recently Doom and Quake.
The four people logged into this workstation don't even notice when a Quake
is fired up.

As a test, I'm now going to edit a file in a FrameBuilder (bloated software!) window while two CPU intensive games side by side. Four people are logged in doing light editing and compiling tasks.

What do you know? The keyboard response is instantaneous. The game windows are smooth. Hey, this video card even supports different hardware colormaps for each window, so each game can manipulate all 256 color entries to its contentment!

This is an old workstation, about as fast as a Pentium 100 in some respects.

Did I mention that it's running an Informix database, and pretty hefty telecommunication management software?

Maybe you should wake up and smell the rotting net spam! :)

Christopher C. Wood <christw@lexis-nexis.com> wrote:

>Bullshit, JEDI, Bullshit. MacOS drives serial port servicing from
>interrupt routines; I can detect no impact of a background modem
>download on foreground tasks.

There is more to downloading than just an interrupt routine to dequeue
data from a port. The data has to go somewhere.

Does the service routine also do the disk I/O transfers (which would be a crude
hack, at best), or do you have to wait for a _voluntary_ context switch to the
task which is performing the download?

What would happen if the download were taking place at 1mbps? How about 10mbps?

For a download at say 28.8 kbps, you only need a three to four kilobyte buffer,
and the assurance that someone reliquishes the CPU in your favor once a second.
No big deal.

However, what if some CPU intensive program holds up the processor for a few
seconds? Does your download continue? How does the interrupt service routine
obtain buffer space? Is it fixed or dynamically allocated? What happens
when it overflows?

In an operating system, the arrival of data on the serial port may cause an
immediate context switch to the process associated with that data stream, so
that the process can remove the data from the operating system's buffers.
Furthermore, in an OS with real-time support, you can give the process a high
priority so that it's _guaranteed_ to get the CPU as soon as data is available
from the serial driver.

Face it, MacOS is a kludge with a pretty face. No preemptive scheduling, no
time slicing, kludged multiprocessing support, no globally scheduled threads.
It's simply not a serious contender except for hobby / home uses and special
purpose applications (e.g. public-access information browsing terminal or a
server for providing a small number of services on a single network wire).
The X terminal I'm using doesn't multitask either; it runs a monolithic X
server: one task. It doesn't matter though because it is a special purpose
hardware and software combination (``appliance'') that does its job well. I
could easily replace it with a Mac running MacOS without loss of functionality,
provided I could find stable, up-to-date X software for it. It would be a waste
of a workstation, though.

Perhaps you should word that differently: ``the one thing I don't like about
Civ2 is that there isn't a Linux port''. You can't blame Linux in this.

Quake runs; what's Civ2's excuse?

Those studies were flawed if they only considered how PC users interact with
their operating systems. How else can they interact but in the prescribed ways?
They are used to working around the limitations of the system.

If you asked a bunch of Kaypro or Osborne users about how they use their CP/M,
you might be surprised to discover that users don't need task switching at all!

I made a mistake. That's where I got the 3.02 from. I must have been
thinking of IE's latest version/revision number. My Netscape is
actually 3.0.

Those are two names you don't hear very much anymore. I have two Kaypros
sitting in my closet. A 93 II and a 94-2. Still work fine. Wordstar, Turbo Pascal, DbaseII
etc. CPM 2.2G is probably the only bug free operating system in existence. AFAIK.

Jeff

: :BTW, for anyone who is reasonably clear about the technologies, GIF
: :doesn't cut if for images because of the limited colors, and JPEG
: :doesn't cut it because it is lossy, so if you saved an image every
: :time you altered it, it would degrade.

: Isn't it JPEG's *compression* algorithm that's lossy?

: If you don't compress it, you shouldn't see losses.

Yes, but you *will* see a very large file - the whole point behind the use of lossy compression in JPEG is that it gives you a very high level of compression. If you're editing your own pictures, of course, then you just have to keep an uncompressed (or losslessly compressed) copy lying around and make the alterations to that each time. Otherwise you will see some degradation every time you change it, though probably not as much as you might think...

I've had about 3 Atari St's in my time. :)

>A while before that, I had the great good fortune of buying an Amiga 1000 for
>$40...so I now have some more antiques for my collection. I think I can use a

That was lucky.. :)

>(right now, I'm using a Pentium Overdrive on a 486 motherboard...).

Why are you in an Amiga NewsGroup, if you are not advocating the Amiga, much
less why are you using a PO486, on advocate?

>Back before there were IBM clones, I wanted to go to 16 bits without spending

Not correct. you didn't really upgrade you machine, from my understand, clones
try to keep conpatablity with the old XT's and there for the processor is still
only 8bit, but that has change since the 486 I think. (IMO)

>but I just don't see any *reasonable* alternatives to Wintel. Alternatives I
>can recommend to my friends - and feel that I've been conscientious in
>respecting
>*their* interests, not just my opinions.

(IMHO)
Personally I don't like following the crowd, who knows where they'll end up, I
live with 3 pc clones, not my own someone elses, and personally I've installed
windows to the 486-dx100 about 30 times because of mafunctions in the software
so that counts out 95 for me, NT/OSWarp I've never seen, MS-Dos is an basically
a crippled version of something that AmigaDos pisses on from a great height,
you don't have conclipping in ms-dos nor do you have the option of just typing
the name of a dir and it cd'ing to it itself, you have to with out choice of
yourself type 'cd thisdir' your limited to 8 chars and 3 extension, where as
AmigaDos is not limited to this, if I want to make a file/dir with an incorrect
chars to it on ms-dos I can't on the Amiga I can, in retrospect you can
get interesting play toys for ms-dos that inharce it --to a degree-- but even
those are pritty out dated compeared to AmigaDos.

Let's not forget while pc's just beeps we had stereo sound.

That's likely true, thinking about it - small changes, especially if
they are not sharp features (or came from "similar" pictures), would
be likely to result in DCT coefficients having about the same spatial
frequency cutoffs. So little information would be lost...

When I was writing the book on Photoshop I took one of the images
included with Photoshop, JPEGed it, and then re-opened it alongside
the original. I examined it at multiple magnifications and could find
a few differences, but not enough to make it clear which was the
original and which was the JPEG.

I seem to remember that it was the middle setting for compression.
It's just possible that althought the image wasn't in JPEG format, it
may have been JPEGed at some stage of its career. Maybe I should try
one of the Kai's Power Photos.

Actually, it appears to be that even when a interrupt service routine is
finished, the CPU remains executing within the operating system and it
is the OS that returns the CPU to the application. It would also pretty
much answer the points below because once the interrupt is made, the CPU
must complete the entire task that includes moving the data from the
serial buffer to where it needs to do. The interrupt would have ensured
the top priority context switching. It is only when the OS is done when
everything is returned to the application. Everything is still done in
the context of cooperative multitasking.

I have uploaded and downloaded large amounts of data under CMT
enviroments, for both Mac, Windows 3.1 and Novell Netware 3.12.

CMT poses a lot of problems when it comes to multitasking, but
downloading isn't one of them.

Try subtracting the jpeg from the original (in such a manner that the
difference between 2 identical images is grey 128), and then doing a
histogram EQ. That will give you an exaggerated view of the
differences.

The artifacts will elude many types of processing, but they get
emphasized pretty quickly with some others. Some of the effects I've
created with filter factory have turned very nice looking jpegs into 8x8
tiles with sinusoidal eye candy in them.

Actually, the answer is quite simple. WM_PAINT message recieve very low
priority in a Win32 system. This means that the system will only paint
when there is nothing else to do. Obviously there was something else to
do. This can be changed of course in NT by setting foreground apps to have
higher priority. In 95, however disk intensive activities do cause slower
multi-tasking performance.

Hello Atari fans,

-I'm here letting you know about the Atari Preservation Society. The APS is a group of Atari fans trying to keep the Atari Experience alive into the next millinium!

-The APS has only been around for about four months and already has 200+ members, including Telegames, a Jag/Lynx game developer! We are looking for more members, so we can try to influence JTS!

-If you'd like to find out more about the APS, or become a member, make sure to visit the Official web site at:
http://www.geocities.com/SiliconValley/Vista/1863/main.html

Thanks for your time,

Megabyte,
Official APS Member!

That depends on your disk and controller. On 486 machines with older
IDE controllers, full throttle disk access (usually about 2.5 megs/sec
max) took 100% cpu. On my cheap 430FX pentium board, my main drive gets
almost 8 megs/sec with about 40% cpu utilization. It is pretty rare
that screen updates are late, even with disk activities going full
throttle.

I'm sure games will find uses for all that spare CPU time - for example,
monster intelligence has nothing to do with 3D accelerators.

How is this dumping? It is a product designed to run on a totally
different platform.
Oracle and their ilk enjoy the most healthy of profit margins in the
computer industry.
If it had been *any* other company other than Microsoft that was
offering the same
product at the same price, then you would not call it dumping. Unix
vendors like Sun
are still living in the past when they commanded high prices from
government agencies and
big companies. Now that the natural evolution of the computer industry
has made hardware
so much cheaper, those guys are running scared trying to figure out
where they can
inflate profit margins. Trust me: Scott McNealy and Larry Ellison are
not out to topple
Bill Gates and Microsoft to do any of us a favor. They fully intend and
expect to become
the next monopoly. Don't believe me? Go read todays San Jose Mercury
News story on Oracle at
http://www.sjmercury.com. Pay attention to how Oracle has a plan to be
the one-stop-
computer-shop (from high end servers to home users).

>
> When will Mircosoft learn how to play fair? Gates and co. are merely a
> bunch of big bullies taking advantage of their position.

Microsoft plays as fair as any other company. In fact, their licensing
is alot more
equitable to cloners than, say, Crapple's, er, Apple's. In fact, Apple
cloners like UMAX

and PowerComputing are contemplating getting into the PC market because Crapple is
so wishy-washy towards the cloners. When Crhapsody comes out, it is only going to be
worse for the Mac-cloners.

>
> At this point, I wish Microsoft's people would cash in their stock and
> retire. They're not making decent operating systems, let alone end-user
> software.

My first computer was a Mac 128. I used Macs for a very long time until NeXTStep became
affordable for Intel. I used NeXTStep for awhile along with Ultrix, Solaris, and IRIX.
After a brief stint with the BeOS, I recently began using WindowsNT (with 3.51). Now, I
think I am about as an objective person to say this: "WindowsNT does not suck as bad as
you say it does." Let me repeat that: "WindowsNT does not suck as bad as you say it does."
On a Pentium 133 with 32MB RAM and 512KB cache, my machine is as responsive as anything for
normal tasks (for largescale 3D tasks, it slows only because my video card is an ancient
Diamond Stealth with 2MB of memory). I can get LaTeX, anything related to the WWW, very
nice development environments (NeXTStep was better), etc. Microsoft does make decent
operating systems.

John

That's odd. Shouldn't such a task become blocked and thereby allow other (lower priority) tasks to get time? Or, is this still processor assisted transfer? I suspect that the affect would be much less noticable with bus mastering (I thing you call it... when there are separate chips to handle the informatin transfer rather than have the processor deal with it).

This depends on the design of the hard disk controller.

Most clones have bus-mastering capabilities on their IDE controllers,
however most people do not install the drivers and thus default to
programmed I/O.

Running full tilt on my machine with DMA busmastering enabled, my IDE
subsystem consumes no more than about 5-10% of the CPU's attention. This
is a P100.

Bus-mastering SCSI obviously has even better performance characteristics.

992. WANTED: DOS Utilities ROM card (HPC-701) for the Atari Portfolio

Newsgroup: comp.sys.atari.advocacy
Date: 1997-05-27 00:00:00 UTC
From: Chris Platts <chris@the-shack.demon.co.uk>
Message-ID: <01bc6ae7$29bd6940$4a9cdec2@the-shack.demon.co.uk>
Source record: 6096

Anyone out there (pref. in the UK) got this card?

Atari DOS Utilities ROM card (part no. HPC-701)

Will buy or swap old Atari gooides! -- ST/Falcon stuff...

Yes, the task is blocked while waiting for IO, but unfortunately the OS is
also waiting for IO so it can swap pages in to the system.

Indeed. I couldn't agree more, especially as I said excatly this a few
weeks ago (probably in the same thread, judging by the length of time
this one's been going). Having smaller programs also helps you keep the
memory of your machine in control. If you have huge sprawling programs
that try to do everything at once and do it before you've even thought
about it (and usually getting it wrong) then your memory goes in large
chunks whereas if you have small programs that are more 'dedicated' then
you can load them, do your operation, and if you know you won't need
them again then just quit them straight away. Easy. Hell, if you DO need
them again then just load them again - it'll only take a few seconds!

Loading something like PhotoDesk or PhotoShop just to make a little red
circle or loading Impression or Word 8 to create a quick note to stick
on your monitor is overkill.

In the case of Impression, overkill.

In the case of Word 8, over-over-over-overkill. _How_ much memory does
it use?

Say what? IDE DMA is a relatively new thing. Not all motherboard types have it.
Wasn't it introduced on the Triton II? Perhaps most _new_ clones have it.

The ASUS dual pentium motherboard I bought over a year ago certianly doesn't
have DMA for IDE drives.

There should be some way in modern operating systems to limit the amount of memory a program can access, so that one misbehaving program won't be able to take up all your memory. It will be like setting the priority in a preemptive multitasking environment. The applications should have settings for the minimum and maximum amount of memory they need, and the user should be able to adjust the maximum value manually. This shouldn't be left to the programmer of the application. Modern operating systems should not crash from a misbehaving application. If applications have a maximum memory partition, then when the application needs more memory, it should ask the user for it or in the worst case just crash, without affecting other applications. The MacOS has this, so an application cannot take the whole memory. Other applications running always have their maximum amount of memory available. It used to be wasteful in the past, but now memory is cheap.

Gabe

You dork, it is suppose to rhyme. If you are going to bash Atari users then learn to cite a rythm correctly, or at least put capital letters and the correct puntuation where it belongs.

MacOS does this by using fixed addressing for application memory spaces.
The stack starts at address 0xso-and-so, and the heap starts at address
0xthus-and-such, and they grow toward each other.

If the stack overflows into the heap, it's crash city. But, by god, the
application won't take more than its fair share of RAM on the way down.
;)

For Unices there is system call setrlimit() for adjusting maximum
usage of system resources. There are two flavours of these limits:
hard and soft. Soft limits can be set only within range of hard ones
and hard limits can only be lowered (to increase, application must be
run in priviledged mode). Many shells have 'limit' or 'ulimit'
builtins around the function (at least bash and tcsh) and these limits
are inherited by child processes.

However, the only way to set these limits is to inherit or set them by
application itself. And in the second case there is a little sense to
do it interactively: if application is samrt enogh to watch out it's
limits, it usually is smart enough not to exceed them (btw, how could
you expect daemon running in background asking if would you be so kind
and spare it some extra memory? who should be asked?),

But another matter is if program will behave correctly after failed
attempt to exceed limit (e.g. trying to allocate more memory). I've
seen many 'Virtual memory exhausted'-like messages so I'm not so
optimistic.

> Modern operating systems should not crash from a misbehaving
> application.

Only 'system crash' I happened to have under Linux was console's
keyboard/screen lock and I believe I wouldn't have to reboot machine
if I had an extra terminal plugged to my box. IMHO, isolating
applicatons from itselves and the OS is standard, not The Holy Grail.

> but now memory is
> cheap.

It's true but don't rely to strong on it. Memory hogs are always
annoying, no matter how much memory do you have.

There is; it's called adjusting the working set. A more crude adjustment is to
simply say ``you have this much virtual memory to play in, and no more''.
Easily done with process limits in Linux. You can set how much memory a program
can have, how deep its stack can be, how long the program can run for, how big
of a core file it can generate, how big a file it can create, etc.

They could have at least used the correct spelling for St. Louis
(instead of St. Luis). They were referring to the city in Missouri (I
saw the picture of the Gateway Arch), not some other person/place/thing.

Casper, your opinion, shall we say, is generous compared to mine. I'll
leave it at that.

No Atari, Apple, Commodore, DEC, Handheld, HP, etc. stuff (actually not any computer stuff) to be found there what so ever, just a bunch of pictures of 'the outside' (augh! the light, no computers! no net! I'm melting....)

The buttons were hard to understand I assumed incorrectly uou click on the blue thingis below the names to go to different pages, wrong. Also takes forever to view if you have a 14.4k modem.

Post back here to us when you get some good computer shots, ok.

The Triton 430HX chipset does support dual Pentiums.

The Triton HX chipsets are also available since last year, and they do
support IDE DMA, though not the latest DMA-33 kind the 430TX supports.

I am reading something similar with the IDE drivers of Warp v4 running
on a motherboard with the Triton HX chipset. Remember, these drivers
are installed in default by Warp v4.

All I know is for over 2 year now IDE DMA was available on low end
motherboard. I gather that from my pre win95 system that suport busmaster
dma. The triton FX (1) had that feature.

What I don't like about Mac memory usage is that after applications take their preferred memory size, the applications continue to hold onto unused memory which other programs can't use. So if I run Photoshop with a 50 MB preferred memory size just to view a 100K GIF file, Photoshop will still hold onto the entire 50 MB even though it is actually using only 10

or so megs. Do you acknowledge that this is a problem? I suppose you might tell me that is so easy to adjust Photoshop's memory usage to just 10 MB. But ease should not be confused with convenience or practicality. My point is that I should not have to constantly consider and set how much memory I intend to use each time before running an application just so I don't end up wasting dozens of megabytes.
Sure, it's nice to be able to limit Netscape's memory hogging. But instead of applauding the Mac's memory setting ability, shouldn't we also point a finger at Netscape for hogging the memory in the first place? In addition to being able to set maximum memory usage for applications, all Mac programs should release memory they are not using, instead of holding onto fixed partitions of wasted space. There should also be a default "Unlimited" mode which lets software automatically take as much memory as they need (and give back what it's not using, as it should always do).

Unix: use the 'ulimit' command in your preferred shell.

```
Linux resource limits:
RLIMIT_CPU /* CPU time in seconds */
RLIMIT_FSIZE /* Maximum filesize */
RLIMIT_DATA /* max data size */
RLIMIT_STACK /* max stack size */
RLIMIT_CORE /* max core file size */
RLIMIT_RSS /* max resident set size */
RLIMIT_NPROC /* max number of processes */
RLIMIT_NOFILE /* max number of open files */
RLIMIT_MEMLOCK /* max locked-in-memory address space*/
```

> On the Mac, the programmer _suggests_ values, but the user can
> override. On Unix, you need to be a programmer to understand what the
> limits are, let alone to set them.

On Unix, the programmer mallocs and lets the OS worry about allocation.
The user can impose upper limits, if he or she so desires.

I can understand why it's sometimes preferable to impose an upper bound
for memory and file usage, but why on earth would one need to impose a
lower bound? "Hey, the program doesn't need the excess, but I INSIST ON
WASTING IT !!??"

That minimum & preferred memory usage thing is more an indication of
limitations in the MacOS memory management, and it isn't anything like

the ulimit command in Unix shells.

> With memory cheap and the improvements in the Mac's virtual memory

I don't think needing to block out a contiguous memory space on program start-up is an advantage; in fact it would be sad and lame if one still has to do so even though the underlying kernel has an efficient VM that doesn't require such things. I mean, that would be taking a real deficit making it into a virtual deficit...

> How does this work on Win95/NT?

File limits, 3rd party. Memory limits, dunno. But why would you need to set a minimum contiguous block of memory in those thingies?

It isn't a problem if you are using a decent VM scheme -- I use
RamDoubler 1, but I hear that 7.6, maybe even 7.5.5 is acceptable. My
powerMac has 24 Megs of real RAM, and RamDoubler tells MacOS that it
has 48 Megs. Were I to open up Photoship with a preferred memory size
of 30 Megs, and then open up a 100K GIF file, most of that 30 Megs
of RAM that photoshop thinks it has are virtual -- with RamDoubler,
they're nowhere until PhotoShop actually uses them for something.

If you are running a reasonable VM implementation, those "wasted
megabytes" are virtual, not real.

You don't understand virtual memory, do you? Learn about it. There
are well-known mechanisms to provide the benefits you desire, without
a lot of the side-effects and complications your scheme would also
generate.

|> There should also be a default "Unlimited" mode which lets software

Unix programs don't work this way. Mac programs don't work this way.
Do windows programs work this way?

And Adobe rep recently visited Capitol Macintosh (Austin's Mac User Group)
and told us that their products do their own memory
management...essentially their own VM. I didn't think to ask what they do
on a Windows system.

I believe there is a great deal of room for improvement in Mac's memory
management and I'm curious to see what's planned for Rhapsody in that
department.

Regards,

Jay

I get 6 megs/sec on my 430FX motherboard with a 2 gig Maxtor, and 7 and
8 megs/sec respectively with my 3.1 and 4.0G WD Caviars. Maximum cpu
usage is about 40%.

On the other hand, if you allow a program a huge stack, it should not necessarily chew up physical memory unless it's actually used. On the Amiga (and minux and others) you had to be careful to select an appropriate stack size - too small, and your program may crash, too large, and you waste memory.

With VM systems, its easier to allow a huge stack, yet no memory needs to be committed if it's not used. Usually, it's easier to put a limit on total memory used, rather than just the stack.

Linux supports more limits than these two, see below.

>On the MacOS, you click on the application's Icon, choose "get info",
>and set it's minimum and preferred memory usage.
>
>Which one's easier?

That you can even compare the Mac's abomination with UNIX process limits
indicates extreme cluelessness.

For one thing, process limits are associated with *instances* of processes, not
the executable files themselves. One instance of the same program can run with
different limits from another instance. In MacOS, you can't even run multiple
instances of the same program, the last time I checked, not to mention
run multiple instances on behalf of different user. Is it therefore surprising

if the user interface for setting the limits is ``easier''?

Secondly, you don't set aside fixed-sized partitions for a process in UNIX. With the Mac, the user _has_ to know about ``Get Info'' and fiddle with it. UNIX users don't need to be aware of process limits; it's more of a security feature than anything else. I couldn't care less how much memory is needed by my Vim editor, the ``grep'' program, Netscape or Wordperfect. Why should a user have to know what kilobytes are or how much of them a program needs? Why should a user have to open and close applications in a certain order to reclaim memory? Why should a user have to get a message like ``there is not enough memory to complete the operation'' even though there clearly _is_ enough memory, and then have to close the program, adjust the Info and try again?

Incidentally, in Linux you can control a rich variety of settings with bash's ulimit command:

```
linux:~>help ulimit
ulimit: ulimit [-SHacdfmstpnuv [limit]]
Ulimit provides control over the resources available to processes
started by the shell, on systems that allow such control. If an
option is given, it is interpreted as follows:

-S use the `soft' resource limit
-H use the `hard' resource limit
-a all current limits are reported
-c the maximum size of core files created
-d the maximum size of a process's data segment
-m the maximum resident set size
-s the maximum stack size
-t the maximum amount of cpu time in seconds
-f the maximum size of files created by the shell
-p the pipe buffer size
-n the maximum number of open file descriptors
-u the maximum number of user processes
-v the size of virtual memory

If LIMIT is given, it is the new value of the specified resource.
Otherwise, the current value of the specified resource is printed.
If no option is given, then -f is assumed. Values are in 1k
increments, except for -t, which is in seconds, -p, which is in
increments of 512 bytes, and -u, which is an unscaled number of
processes.

linux:~>ulimit -a
core file size (blocks) 10000
data seg size (kbytes) unlimited
file size (blocks) unlimited
max memory size (kbytes) unlimited
stack size (kbytes) 8192
cpu time (seconds) unlimited
max user processes 256
pipe size (512 bytes) 8
```

```
open files 256
virtual memory (kbytes) 2105343
```

The difference betwen a hard and soft limit is that a hard limit is absolute and can only be adjusted downward, but a soft limit can be adjusted up and down, within the confines of the hard limit.

The sysadmin can easy set the limits by dropping a suitable ulimit command into /etc/profile, such as:

```
ulimit -HS -c 4096 -d 2048 -s 2048 -u 5
```

allowing the user 4 meg core files, 2 megs of data space in a program, a stack size of 2 megs and no more than five concurrent processes.

The limit on number of processes has the curious and useful property in that all of the user's processes are counted against the limit, but each process has its own independent limit that is tested when it tries to fork. Thus the limit is good for system security as well as for confining a particular application.

It's a problem, and the kludges are not a real solution. Apple has finally
woken up and commited to a plan for relegating MacOS to the trash can where
it belongs, while continuing to protect the investment in MacOS applications.
This is a smart move.

There is still only one address space, though. What if some program claims
most of the global virtual address space? Even if none of it is mapped, you are
screwed.

Contrary to popular belief, virtual memory is not entirely free. If you don't
have separate virtual address spaces, then the single virtual address space
becomes a shared commodity. And even if you have separate spaces, virtual
memory has to be backed by swap space. Otherwise you have an ``overcommitted''
situation in which a process is falsely led to believe that it has been granted
more memory than it can actually used, and the system may not be able to supply
actual pages for the entire allocated region before its swap and core
is exhausted.

In other words, you can't magically create RAM by pushing out unused stuff into your swap space. Eventually your swap will fill up too, and then what do you do?

Either Ramdoubler can detect that a piece of memory is truly no longer in use and completely remove it from the virtual address space, or it can only remove it from RAM, but save a copy in swap so that it can be recalled should the program need it again. (I suppose that it could also make special provisions for memory containing all zero bytes.) I would be surprised if a cleverly written program wasn't able to defeat such schemes by using its heap space in unconventional ways. You can't look at a piece of memory and know whether it is in use without making assumptions about how memory is internally managed by the program. Thus you can never know whether it's safe to meddle in that program's affairs by removing that memory. Sure, if the memory contains all zeros, you can always recreate it on demand, as a special case hack. But what if it does not?

Is it not true that Ramdoubler depends on the good behavior on the part of an application? (Like what doesn't, under MacOS).

Maybe he understands the way virtual memory _should_ work in a properly designed system. Apple Inc is starting to understand virtual memory. Hence the plan to phase out the MacOS kludge.

>|> There should also be a default "Unlimited" mode which lets software

>
>Unix programs don't work this way. Mac programs don't work this way.
>Do windows programs work this way?

UNIX programs *can* work this way. It depends on how your application was written. When a UNIX process unmaps memory mapped regions or adjusts its ``break address'' downward, it is really giving back virtual memory to the system such that it is available for whatever purpose the operating system sees fit. The released pages can, for instance, be assigned to an arbitrary place in another process' address space.

Good allocator libraries take advantage of this capability. It's more of a programming language or library issue than an OS issue. If you write a

heap-compacting storage allocator in UNIX, you can give it such behavior that it will minimize memory usage. The heap-compacting allocators in the Mac's toolkit can't actually give back memory to the system, only to the application's partition.

This discussion seems to be focused on virtual memory systems that have
lots of paging going on. From what I understand, in a nutshell, native
PowerPC software with System 7.5.5 and 7.6 can do more extensive paging of

application code to the disk so the apps can use less physical RAM. But how does this address the fact that applications still reserve large fixed chunks of physical RAM, neither taking more physical RAM when needed nor releasing physical RAM that is not being used? Even when an application is paging to disk, doesn't it still hold onto unused physical RAM in its "Preferred" memory setting? Isn't this the same as when virtual memory is turned off?

In contrast, consider what RAM Charger does for the Mac. RAM Charger is made by Syncronys (see the web site and related articles at www.syncronys.com/ramcharger/). This is what happens when you turn off virtual memory and set RAM Charger to open applications in a very small inititial RAM space and access all available physical RAM. Of course, not all Mac programs will behave ideally with RAM Charger due to the vastly different memory usage schemes. When you look at the "About this Macintosh" box, you'll see that application's memory partitions are a lot smaller and there is very little unused RAM in the partitions. Now, do something that will make an application exceed its current memory usage, such as opening lots of large files. Looking at "About this Macintosh" you'll see that one of two things:

1) The application increases its memory partition by only the amount of RAM necessary at the moment so the partition contains very little unused physical RAM, or

2) The application takes physical RAM from the System heap so the System Software appears to be increasing its RAM usage.

Now close all those large files and you'll see that either the application's "preferred" memory partition or the System Software paritition has gotten smaller, again with little unused space in the partitions. I'm probably not doing a good job of describing it so I'll just quote from the RAM Charger FAQ:

"What is RAM Charger?
RAM Charger is powerful, install-it-and-forget-it performance software for your Macintosh. Your Mac OS does not manage RAM as efficiently as it could. The Mac OS grabs and reserves RAM in fixed blocks for each program you open. Unneeded RAM is not released and additional RAM is not taken. As a result, free RAM is not delivered to where it's really needed, and you often hit the
all-too-familiar 'Out of Memory'. RAM Charger adds dynamic RAM management to your Mac OS. Programs launch within smaller blocks of RAM which automatically resize as you open, revise, and close files and programs."

"Dynamic RAM management - what will this do for me?
This means that you can run more programs, run larger programs without constantly changing their "preferred" sizes, and make your Mac OS more stable and reliable. In more detail, a RAM Charged program will only have allocated to it the amount of RAM nearly equal to what it currently needs. If the program requests more RAM within what it thinks is it's fixed memory block, RAM Charger is able to add the requested amount to what is

allocated to the application, from the total pool of unused memory. That means each RAM Charged program has access to all the RAM available, not just what is allocated to it in the initial block by your operating system."

Syncronys notes that RAM Charger is not necessary for Windows because Windows (and Unix?) already operate in this manner. So should MacOS.

Additionally, stack area and memory usage have very little to do with each
other. The stack is used for local variables of functions, essentially.
If you have recursive functions or functions that declare large arrays as
local variables, you need a lot of stack. Given that the stack has to
be continuous to work, a system that doesn't use the MMU has to set aside
the largest allowed space right away, and if that space isn't large enough,
well, tough. If you are lucky, it might get caught --- if not, the stack will
just overwrite something else in memory.

The amount of memory a program uses, however, is normally dominated by the
dynamically allocated memory, which does _not_ come from the stack, but from
what used to be called the heap --- although that term seems to have been
dropped with the advent of multitasking. This is the sort of memory malloc()
will give you.

>With VM systems, its easier to allow a huge stack, yet no memory needs to
>be committed if it's not used. Usually, it's easier to put a limit on
>total memory used, rather than just the stack.

Exactly. A VM system can pretend that each process has a flat address space
all for itself; The old single-tasking model of stack and heap, one growing
from the top and the other from the bottom, can be applied again; Of course,
physical memory only gets committed when a new logical page is actually used.

In such a system, it is extremely easy for the OS to keep track how many
pages it has committed to a certain process, and to refuse any further
pages when the limit has been reached.

1038. Online Linux User/Support Group

Newsgroup: comp.sys.atari.advocacy
Date: 1997-06-05 00:00:00 UTC
From: Peter <peter@linuxware.com>
Message-ID: <5n7gr8$4gu@linet06.li.net>
Source record: 6142

```
************************************************
* LinuxWare.com, an Online Linux Users Group *
* Account and Site Information *
* ////////////***\\\\\\\\\\\\\\ *
************************************************
```

PLEASE NOTE: LinuxWare.com is a Linux Support, Information, and general purpose Linuxer Hangout Site. We are setting up LinuxWare.com to be a meeting place for people interested in learning more about Linux, providing help to other Linuxers, and promoting Linux!!!

To facilitate this, for starters we have setup a local Linux Support mailing list for our members , an online Linux support forum, online Linux Books, and more. We would like this site to become a sort of "On-Line Linux Users Group", any suggestions are more than welcome!

Members of LinuxWare.com can use these services to get Linux support and also help out other Linuxers. This is what using Linux is all about!!! :) Everyone here is encouraged to participate as it is the main purpose for running this site! Please help out your fellow Linuxers!!!

Also, full shell access is available so people who have never tried Linux from the shell prompt can give it a shot. Also, shell access is provided so people can see how this site is setup. Use of the gcc compiler is also available apon request.

As you can see from the above, the use of this site is clearly restricted to supporting Linuxers and promoting Linux!!!

Here's a summary of what's currently available!

*Internet e-mail *World Wide Web
*FTP *GCC
*Full Shell Access *Local Mailing List
*Linux Support *Web Space
*Telnet *Internet Relay Chat
*UseNet *and more!!!

If you don't see something you like, just ask!!!

For more information on obtaining an account, please goto http://www.linuxware.com

Enjoy!

Peter Lazecky

Could someone demonstrate a working ulimit on Linux, because 'ulimit
-m' does not seem to restrict the RSS, and 'man ulimit' tells me the
system calls are obsolete and/or unimplemented. You don't need to be
a wizard to read the kernel source for the ulimit call
(2.0.30,/usr/src/linux/kernel/sys.c):

asmlinkage int sys_ulimit(void)
{
return -ENOSYS;
}

So, what works and what doesn't?

1041. Win95 OSR 2.1 CD $35 W/Fat32, Fat converter, Full install

Newsgroup: comp.sys.atari.advocacy
Date: 1997-06-07 00:00:00 UTC
From: jasonben@aol.com
Message-ID: <5nc8ts$d7n$905@usenet85.supernews.com>
Source record: 5950

Win '95 OSR-2.1 on CD with Fat32 Boot Floppy, FAT to FAT32
converter; $35 + 4.50 for Postage/COD, or offer.

Full install version. USB Support. This CD also contains
the Microsoft FAT to Fat32 converter.

Are you tired of losing up to 40% of your disk capacity
to the huge cluster size of FAT16, P-n-Pray that does
not work, poor pcmcia support, misidentified motherboard
resources, CPUs, ect?

Well, moving to the OSR 2.1 version of Windows '95 is the
answer.

Win '95 OSR2 also contains important patches, an expanded
(and debuged) drver library, PnP that works, GUI improvements
and bug fixes.

Yes - Some, not all, of these are available for as downloads.
Yet - The most important parts: *FAT 32*, the Kernel and GUI
enhancements, PnP improvements and proper CPU identifier codes
are NOT available for download and currently can only be
obtained with the purchase of a new computer or "memphis"
(Win'97), whenever that will be available.

The CD is the full install version. Included is a OEM cd-key,
an OSR2 boot floppy for creating a new FAT32 partition, MS CVT.EXE
for converting a FAT partition to FAT 32 detailed installation
instructions. In addition to these instructions, there is full
documentation on the CD. There is no "paper manual." Except
detailed installation information. Your current Win '95 manuals
will still apply, with a few *highly documented* exceptions.

The primary reason for migrating to OSR2 is, of course, FAT32,
which increases the storage capacity of your drive simply
by keeping the cluster size at 4K, despite the size of your
hard drive. It also recognizes partitions larger than 2.1g,
the current Win '95 limit.

I was hoping to get $ 35 for the CD, Boot Disk and instructions,
+ 4.95 for USPS COD. I am, however, open to reasonable offers.
I will pay shipping on pre-paid orders.
E-mail for more information.
Jason

The ulimit command in the Bash shell uses getrlimit and setrlimit.
The RSS limit corresponds to what is listed for ``maximum memory''.

Don't trust the RSS column in the ps listing. It's misleading. For instance,
it will count shared memory regions as though each process had its own
copy.

I don't think the RSS limit actually works; that is, it's not ever
checked under any circumstances. You can grep the whole kernel source
tree (2.0.30) and you won't find a reference to it.

PHOTO PHOENIX INTERNATIONAL

We are an international New York based agency representing
amateur and professional photographers in the following areas: Galleries,
Business and Organizations, Book Publishers, Paper Products, Consumer
Publication, Newspapers & Newsletters Publication, Special Interest Publication,
and Trade Publication.
We are seeking photographers who strive for excellence in the aesthetic/
creative and technological world of images, who have the talent to capture
the setting and to convey the mood. Your work should reflect a genuine,
pervasive interest in photography as a fine art.
Whether your work portrays conservative, experimental, stylish, or innovative
themes, your project proposal should be well thought out before submitting to
us.
For first contact, please submit a query letter, direct mail flier/brochure,
tearsheets, slides, photographs & SASE.
For amateur photographers, send sample photos and/or slides.
TO ALL: Do not send entire portfolio unless we ask for it. If we are not interested,
you might not hear from us, so please submit material that does not need to be
returned.

Send to:
Photo Phoenix International

Who's bragging? I thought it was quite clear that this MB is a worse
case scenario for a triton motherboard. If you had known enough about
Pentium motherboards to know that the 430FX is bottom-end, then you
might have actually picked up on this subtlety.

I run netscape a lot and haven't had many problems with it crashing.
Since I've seen it crash on Windows 3.1, Windows 95 and the MacOS, it
would be my opinion that Netscape isn't a very well engineered program.
But then, that's my opinion.

The Mac is easier perhaps, but it's not ideal. "real" OS's allow
dynamic memory allocation. Unfortunately, if you allocate 12 meg of ram
to a program and it needs only 4 meg, then you waste 8 meg. I use to
operate a BBS and used MacKennel. Since I sometimes would get packets
of mail that required using 12-15meg of ram, I would have to set it that
high, even though most of the time it only required 4-5meg. This is
where RamDoubler would come in handy, as it uses the unused memory from
a program that is over-allocated.

Most often, the memory is dynamically allocated and released when it's
not needed. Virtual memory is more effiecient and faster under unix than
it is under the Mac. I've seen cases on my Mac where the HD will grind
away for 20 minutes or more and still not have enough memory for the
task at hand. I have 16meg of ram and a 128 meg swap under Linux and
haven't ran out of memory. It also is extremely fast.

Win95 allows dynamic memory allocation. It's virtual memory is a bit
slower than Linux, but a lot faster than the Mac. When it comes to
virtual memory, the Mac needs an improvement compared to everything
else.

Bob

And most importantly... how much did you pay for extra for a few % less of CPU usage when doing maxedout disk access?

Stephan

It sounds like your Mac's virtual memory size was misconfigured. Even under MacOS 7.6, where virtual memory's speed has been improved, you don't want to set your virtual memory size to more than one or two megs larger than your actual memory size (the system's performance will steadily degrade as the virtual memory size is increased). Sure this doesn't give your memory size a big boost, but because correctly written applications utilize memory more efficiently just by turning on virtual memory you'll get more than your one or two Meg's worth of available RAM.

Win95 DOES dynamic memory allocation, but from a static RAM pool size (i.e. physical RAM plus a swap file). WinNT does static RAM allocation with a preset swap file, but dynamically increases the swap file size as more memory is needed up the amount of free space on your hard drive.

1052. Why don't PC's have midi ports?

Newsgroup: comp.sys.atari.advocacy

I would think in this multimedia age that midi ports would be very common.
However...The only major manufacturer to ever recognize this need was
Atari. Why? And why does hardware for audio applications cost so much
more for the equivalent (8 analog outs, optical I/O, etc.) Atari-oriented
pieces? Maybe I'm incredibly dense, but what would it cost to build a
dedicated music computer, with adequate horsepower for net apps, etc.?

The basics of a PC is that it must be hard to maintain,
it looks more professional in that way. :-)
It would be too easy to use a PC if the manufacters
was thinking of making the PC user friendly.

If the PC would have any MIDI ports on the mainboard
it wouldent be at the specifications.
It would have diferent connectors and different midi protocol,
and then called it EMIDI (Enhanced MIDI).... he he he....

Darin Johnson (darin@usa.net.delete_me) wrote:
: >: "theater"/"theatre" is even more trickier.

: For both those words, I have spelled them both ways, depending upon
: having seen one particular spelling a lot recently. It's not like
: it matters much, no one will be confused.

"Theatre" is an artform which is often practiced in a "theater". I get
tend to get peeved when they're used wrong.

: But isn't "lorries" slang? Most of the differences between British
: style and American style English is in slang; official texts, dictionaries,
: and grammar guides are very similar in language, it's the spoken speach
: that differs the most.

lorries == pickup trucks ??? This seems to make more sense in telling the
difference between a little thing with two axles and a big thing with 18
wheels.

: Americans have no trouble reading Agatha Christie or Dorothy Sayers.
: Most have no trouble following along Monty Python either (after some
: practice). I listen to the BBC radio every so often, and I detect
: almost nothing different from NPR radio newscasters, except for
: accent.

Trouble following Monty Python? Some computer guy you are. ;-) <ni! ni!>

: Well, to Americans, an "upper class" sound is not "nicer". But this
: is a silly statement anyway, as Cockney English in no way sounds
: "upper class" (you said even when mispronounced :-).

I guess "upper class" means you don't burp and scratch while talking.

: The problem here, is that there is no one accent. American
: pronunciation may not vary as much as in the British Isles (talk for
: a few minutes and some people may be able to tell you exactly what
: town or district you grew up in; just like in Germany), but it does
: vary quite a bit. People from Nashville, Boston, New York, Texas,
: Detroit, and San Fransisco all speak very differently. (and Canada,
: it's an American country, so they must then speak American English
: too)

Speech patterns vary a LOT in the US, perhaps more so than in the UK.

: So, when you speak British English, which of the hundreds of accents
: do you imitate? When you try to speak American English, which of the

: hundreds of other accents do you imitate? What's "real American
: pronunciation"? Most of this bickering is just over ego anyway. Both
: places have a long history since the dialects diverged, and none are
: more right than the other, except for ego and nationalism.

Ever notice that dialects seem to be diverging?

Check again. Win95 also dynamically increases and decreases the size of
the swap file--I've seen mine go from nothing to half a gig and back.
Perhaps you have Windows 3.x in mind?

Yes- you can even choose what you prefer- If you like you can specify
low/high limits of the swap file- or you can let Win95 handle it all- in
that case the swapfile will be almost zero if you have plenty ram. WinNT
can have multiple swafiles on multiple disks- thats the only difference
I know about
```

Unless you are running an efficient virtual memory implementation like
RamDoubler or Apple's Virtual Memory. Then those "wasted" megabytes
of ram are only virtual; they aren't real.

No. Most often, memory is dynamically allocated, and held by the
program until it quits.

|> Virtual memory is more effiecient and faster under unix than it is
|> under the Mac.

I would want to see benchmarks before I accept that. It _used_ to be
true, because System 7 through 7.5.2 (I believe) had pretty poor
virtual memory implementations.

|> I've seen cases on my Mac where the HD will grind away for 20

VM on the Mac has received dramatic improvements over the last year
(and a half? When did 7.5.3 come out?). And it will get better still
with MacOS 8, and Rhapsody.

There is a difference between the OS handling virtual memory, and
the program requesting and holding dynamically allocated memory. Just
because a program does the later does not mean that the OS won't
page out piece of it.

Its still true. I have no idea what sort of meaningful benchmark
you could devise between Unix and the Mac, but I use both, and
its no contest.

Amazing. Now the Unixen are saying "don't confuse me with benchmarks or facts. My mind is made up." What's funny is that his answer is at least partially right, but it's trivial to test to find out for sure.

One reasonable test would be to run a given benchmark with and without VM on each system.

On Unix, I don't know if you can actually shut VM off, but if your benchmark fits into RAM, it shouldn't have to hit any paging, so there may be _no_ performance penalty. At the very least, I think everyone would admit that the performance penalty for using VM is small in most cases.

On MacOS, you _can_ shut VM off. So, you start the machine with VM and run the benchmark. Then, you reboot with VM off and run the same benchmark. The percent slowdown is a measure of efficiency.

If you're running MacBench or Speedometer, VM only slows MacOS by a couple percent (2% on MacBench last time I checked). Speedometer shows no difference. Other applications show a larger difference.

So, MacOS costs you a couple percent in performance when you turn VM on. On a few apps, you might get a bit more. How this could be "no contest" (even if Unix has a zero percent slow down) is an open question.

One problem I can see with VM on the MAC is the fact that it's co-operatively multitasking. The problem here is that, once a page miss occurs, the system can't just switch on another waiting task, but rather the time used to transfer the missing page from disc becomes real wasted time.

I'm reading this from an Acorn newsgroup. The RiscOS system also uses co-operative multitasking, and from that I can say that VM is a real laugh when compared to something like Linux.

This may be the same with the Mac, that's why Roger thinks it's not worthwhile to actually run a benchmark, the difference is clearly visible.

You're proposing a single benchmark task as comparision. That's not really usefull, because it's the system performance that counts, not the performance of one benchmark.

BTW, the figures (2%) you gave are quite meaningless - I suppose it's the processor time used when VM is NOT actually used, but switched on. What really counts is how your system, the task in question as well as other tasks, the gui etc reacts when the system is actually loaded.

Kind regards,

1066. Distributors Wanted NOW!!

Newsgroup: comp.sys.atari.advocacy
Date: 1997-06-14 00:00:00 UTC
From: Tony Scott <summer@laoffices.com>
Message-ID: <5nubth$84p$7522@cadmium.aware.nl>
Source record: 5975

Hi,

This is a Solicitation Email, we are looking for new TUFF'97 DISTRIBUTORS.
TUFF'97 is a promotional concept for a prospect follow-up system called
"Simple Track". Software designed for Windows 95, 3.11 and NT
machines. (Macintosh users read the NOTE below(*))

Concept:

The TUFF'97 software includes a copy of Simple Track, so you can use this
for your own personal administration (free). However, the TUFF'97 software
is designed to give you BIG TIME credits for just taking the efforts to
PROMOTE it.

How do I get those credits?. Easy, just distribute/promote it. How?
(Give away the software for free, put it on your website/homepage
and let everyone download it. Give it to your friends, attach it by
email etc). With a one time $40.00 (USD) validation code purchase,
YOUR name becomes part of all sofware you sent out to your customers.
When your TUFF'97 software gets validated, all your personal information is
automatically integrated in the software, so everyone knows how to reach
you by phone/fax or email and where to sent the check/money or cash orders.

Basically this is the concept. Offcourse you need the software to grasp
the whole thing. Believe it, there is absolutely no marketing knowledge
required, just ask for the software package, join and start promoting your
own TUFF'97 line. The only thing you DO need is a PC or Mac(*) and Internet.

(*) TUFF'97 is only available for MacOS users running Connectix VirtualPC
or Insignia's Sofwindows 95/3.11. A true MacOS version is not available.

When you're interested in becoming a TUFF'97 distributor and create your own
distribution line, sent a mailto:FiReStArTeR@frodo.com and ask for your
copy of the TUFF software (We'll sent you a download location and install
instructions). This is a serious opportunity, so only serious responses
are processed. If you're not interested, have a nice day.
Best Regards,
Tony Scott

MIDI ports a far more common than one might think.
The catch is that one needs a special cable to access
them. With the soundblasters going all the way back to
at least the Soundblaster Pro 8-bit, the MIDI ports are
piggybacked on the joystick interface.

Absolutely. I am not proposing any single benchmark.

My post was to a person who said there was no way to compare MacOS VM efficiency to Unix VM efficiency.

My argument was that it's not that difficult, at least on the Mac. Choose whatever benchmark you consider important (rendering 3D images, recalculating spreadsheets, switching between applications, whatever) and measure the time with VM on and with VM off.

I agree that Unix VM is better than MacOS. I just disagree with the statement that you can't measure this.

An interesting statement. I completely disagree. The quality of the VM
system is completely determined by the rate at which processes complete in
the system. Your measure would favor a LRU algorithm over a LFU algoritm
because LRU tends to better approximate the mystical optimal paging
algoritm. However, the LRU algorithm is seldom used in practice because it
is very difficult to quickly evaluate recency.

I'm sorry, but I don't see how this is an experiment at all. It seems
to be measuring nothing of importance.

The quality of the VM is not "how much it slows down the MacOS" which
is in itself a meaningless statement. How much an OS slows down is
completely irrelevant because disk speeds (the major factor in slow

operation with inefficient VM implementations) completely outweigh the CPU speeds (the OS speed, if you like).

The quality of the VM is measured by how efficiently it uses the RAM available to the OS. A VM implementation which wastes no RAM (every page of RAM is being used by some currently running process) is better than a VM implementation which is wasteful (process XYZ isn't doing anything useful but has 1MB of pages swapped into physical RAM).

The older versions of the Macintosh operating system had lousy VM implementations, as they would swap entire processes into and out of memory. Newer versions of MacOS are much better and there are third party add-ons which are excellent. UNIX traditionally has very fine grained pages, and so the implementation is often excellent.

However the actual task of comparing VM implementations is not trivial, and cannot be measured with simplistic "divide speed with VM on by speed with VM off and that's it" experiments. There are far too many variables involved (what processes are involved? what are they doing? could algorithms be rewritten to be more efficient wrt VM?)

And I doubt that the results would even be useful, as the MacOS and UNIX are too completely different to be comparable in this area.

You are talking about performance, not quality.

The quality of a system is measured by the extent to which it robust, reliable
and free of defects, and by how well it meets its specifications.

It's difficult to make a meaningful _performance_ comparison between a poor
quality system and a high quality system.

Multics was exceptionally slow. I also remeber that it was designed for
the Honeywell 6000 machines which, if I recall, have dedicated LRU
hardware. I've been reviewing paging algorithms and I can't find a LRU
algorithm that can run as quickly as a LFU algorithm without hardware.

I'm not arguing that LFU is a better approximation to the optimal
algorithm. Simply that it is a better design compromise unless you want to
throw hardware at the problem.

Word has been received that this year's MIST Atari show will be held on Saturday, July 26, in Indianapolis, Indiana. The organizers say this show, the ninth annual, will be the final one.

This year MIST is moving to the Post Road Community Center, 1313 South Post Road, on the east side of the Indianpolis area. The new location is between I-70 and I-74, outside the I-465 circle freeway.

Show hours are 10 am to 3 pm, Indiana time. Admission is one dollar. In past years this show has had displays by vendors, hardware and software developers, magazine publishers, and users groups. All kinds of Atari computers and related products can be found at these shows.

Organizers of the show are: Charlie Sears (317-535-4829), csears at doe dot state dot in dot us. Jeff Hammer (317-244-8492), jghammer at indyunix dot iupui dot edu. Stu Huffman (812-988-7558), shuffman at doe dot state dot in dot us.

Fair enough, my measure of VM quality isn't as good as yours.

> Your measure would favor a LRU algorithm over a LFU algoritm
> because LRU tends to better approximate the mystical optimal paging
> algoritm. However, the LRU algorithm is seldom used in practice because it
> is very difficult to quickly evaluate recency.

LRU fails in only a few cases, like a process accessing 11 pages in
repeated succession with only 10 pages free for use. It is fine for
most purposes, and *has* been used in practical operating systems
(Multics used LRU, for example). Evaluating recency is an issue, but
no more of an issue than evaulating frequency.

LFU also fails in some rare cases. Consider a process which rapidly
accesses a page for a short duration, then doesn't do so again for a
long time. This will keep the page in memory even though it should be
swapped out during the long duration of inactivity. Interestingly an
LRU algorithm does the right thing here.

This is getting off the point though. There are lots of VM
implementations and all of them have their failings, because none of
them can really predict the future. My point was really to show that
the amount of CPU used by the OS is *not* a good metric to measure VM
performance, as the previous poster seemed to think.

I gave a (poor) example of a proper meteric, and you've given a better
one. So you've done what I intended to do, and that should be all
there is to say about the matter.

Hi,

For those into Atari and wanting new and fresh images of never
before seen Atari product prototypes and vaporwares, please stop by and
check out this web site. Last night several new images were added such
as a never before image of peripherals for the Atari Graduate keyboard
like: Wafer Drive, Modem, RAM expander, Thermal Printer. Images of
the 5200 "System X" prototype and cartridges. Also many many unseen
images of other Atari items such as rare 8-bit computers, ST prototypes,
stand alone systems, even an Atari California License Plate! Stop by
and take a look and the would been, could been of Atari....

What elitist crap. There are millions of people who know and care nothing
about computers but use them successfully every day at work and at home.
Do you think people should sit a computer literacy exam before they can
touch a PC? Do you think that the majority of drivers know how a
car works, or care?

I suggest you become a Christian. They also thrive on making pompous
judgements about what other people should and shouldn't do, and as a
group they have a lot more clout than Linux users.

After reading this post, I assume that the fascist that you are referring to in the title "Fascist alert!!" is yourself. Not only do you post elitist crap yourself, you take the opportunity to slight a group that you obviously know little about, and I don't mean Linux users.

First, people have to know how to use a car befreo being allowed on the street. There is an exam. Sure, maybe you don't have to know about the inner workings of the car, but you have to know how to use it. So I don't see the comparison here. People who try to use something without knowing at least something about how it works constantly frustrate themselves. That is where RTFM came from, the simple fact being that if people would take a little time and read the instructions, whether on the computer or in a manual, they'd save themselves time and effort.

Second, although I can't speak for all Christians (unlike yourself) I can say that the foundation of the belief for most is not making pompous judgements or any sort of discrimination. Just because Christians do not believe that everything is fine just as long as no one gets hurt doesn't mean we are pompous or bigoted. Simply we believe that there are moral lines that shouldn't be crossed, and that sometimes putting off immediate satisfaction is more important than simply doing what feels right. Of course, what this actually has to do with computer advocacy I don't know. If you want to spout off like the fascist that you are trying to alert us

to, please do it elsewhere.

"My theories appall you, my heresies outrage you, I never answer letters
and you don't like my tie."

What has so fasistic about the paragraph above? (or maybe in the part
that has been snipped?) See nothing about color/religion/etc in it.

Erm. I don't think that was a troll. :-) Just a case of some ninny
who didn't bother to try and understand what he was reading before
posting some knee-jerk, half-baked ad hominem with the notion that he
might actually hurt someone's feelings.

shrug "Never attribute to malice what can be explained by stupidity."

An extremely good point I'd say, and probably the best commentary on
Christianity I've heard all year. On the whole, I'd rather listen to
Linux users, as they occasionally have something interesting to say.

Agreed. There's nothing more irritating than someone who wants to use a computer but doesn't bother or even want to bother/care about how to use the damned thing. Eventually they come out of the experience saying that computers are difficult. *Using* computers is no more difficult than driving a car or using any other contraption. (Except of course if it's Windows :)

The whole idea behind computers is one of an intuitive, efficent medium by which to interface the with world. Computers are not necessarily supposed to be complicated, nor is it requisite for an end user to know what makes his machine tick. That's the beauty.

> about computers but use them successfully every day at work and at home.
> Do you think people should sit a computer literacy exam before they can
> touch a PC? Do you think that the majority of drivers know how a
> car works, or care?

Most drivers do know how a car works. In Australia you have to undergo a 6 month training period, and then a long driving test, supervised by an expert driver, before they let you drive your own car. Similary for aeroplanes, there is a 6 month intensive training course before you're allowed to fly your own aeroplane without supervision.

My quote simply says that someone who has had training with a computer will be more productive than someone who hasn't. In another sense, the untrained computer user may actually be a hinderance, or even a danger to the computer and themselves, because they have no idea what they're doing. The abundance of computing tutorials proves my statement.

Computers aren't toasters. Strangely enough I needed training before I could use my toaster. I read the instruction booklet which said how to clean out the crumb tray, and what the two knobs on the front meant. I find it ridiculous that people expect to use computers without opening the manuals they get with them, when even toasters have instructions.

> I suggest you become a Christian. They also thrive on making pompous
> judgements about what other people should and shouldn't do, and as a
> group they have a lot more clout than Linux users.

Don't be a moron.

--
The idea that an arbitrary naive human should be able to properly use
a given tool without training or understanding is even more wrong for
computing than it is for other tools (eg automobiles, airplanes, guns

or power saws).

Yes, yes. I agree with that part of your previous argument -reiterated
above.

My point is that to use such a machine involves a willingness to
understand how to *use* it. Knowledge of how it *works* is not a
requirement. I agree. I don't know a single thing how electricity and a
glass booboo makes my room all nice and light, but I *must* know that I
have to plug the booboo in and turn on/switch on the little plastic
thing on the wall so that I can interface with the world when the great
fire in the sky turns off.

Kindly yours,

Funny, I thought the idea behind computers was to do arithmetic very
quickly.

Welcome to the modern world, where expecting people to educate themselves is considered elitist and even "fascist" (the original poster obviously has very little grasp of the term; dare I say he should read a book on the subject?) Ignorance is now fashionable, and people even wear their lack of knowledge as a badge of honor.

Dave Cook

You mean the one that revolves around the big flat disk you're standing in
the middle of?

Actually, the glass booboo (a "globe" or "lamp" to us hardware types) does
much better at warming your room than lighting it, unless you use
flourescent booboos.

No, it's elitist to deny or restrict access to technology to people who are
not educated (by whatever means) to your level of understanding.

> Ignorance is now fashionable, and people even wear
>their lack of knowledge as a badge of honor.

Ignorance doesn't prevent people from using computers these days. Why you
resent this is unclear to me.

CitiBank, Wells Fargo and the US Treasury, just to name a few.

Hast thou forgotten the armies of accountants out there?
Wouldst thou condemn them to a lifetime of balancing spreadsheets by
hand?

It's not a matter of how many but of whom.
Those who pressed for the development of digital computers did
so out of the pressing need for fast arithmetic.

The rest is the result of using a difference engine for arbitrary
linguistic transformations...

Yes it does actually. Watching this kind of ignorance in action can
be rather amusing... (like the MacFool that thinks a UTP cable will
fit into a phone jack (or viceversa))

A spiffy frontend just gives the lazy a false sense of security.

Let's add Boeing designing the 777, Hughes designing a communications satellite, the big pharmaceutical companies modeling HIV protease inhibitors, the NSA trying to crack Chinese ciphers, the Massachusetts DOT trying to predict traffic changes when they close the central artery in Boston, Sears trying to tot up the day's earnings, various pension plans trying to earn money today on Wall Street, the trillion dollar a year international currency exchange market, NOAA trying to predict whether El Nino will reappear this year, and the DOE trying to use computer simulation of thermonuclear detonations to replace actual detonation of warheads.

I mean, duh.

What do you mean, that's what's easy to build with binary digital electronics? The *only* thing binary digital electronics can do is crunch numbers! Remember.. "binary" is a number system (base 2 to be precise).

I'd say lots of people need arithmetic done at blinding speed, ever done any ray tracing? I fiddle around with backpropagation trained neural nets every now and again, billions of arithmetic operations are involved in relatively small neural nets during training.

The only reason computers exist is to do number crunching. Everything you do on your computer turns into numbers.

Wow, this is some rewriting of history. And here I thought the purpose of computers was (a) initially, to do computations human beings can do in principle, but not in practise, and (b) later, also replace multiple office tools (typewriter, typesetter, draftsman, etc.) with one more general-purpose, programmable tool.

I thought one interfaced with the world by means of a face, good manners, and a voice.

Base 2 arithmetic is used because it's easy to build electronics that
support it (I have seen base 3 done with 3 voltage levels, as an exercise).
In fact the basic non-trivial digital operations are two-input gates. These
build into latches and flip-flops, which build into counters and arithmetic
engines. FWIW.

>I'd say lots of people need arithmetic done at blinding speed, ever

I'm not arguing that arithmetic isn't essential for computer applications.
But in many cases applications are implemented arithmetically because
that's what computers do, not because that's the best algorithm for the
task. Why should word processors or linguistic expert systems be
implemented in this way?

>The only reason computers exist is to do number crunching. Everything

Huh? Computers exist to help people do things. You've got the cart and the
horse backward :-)

I read Kiddy's message and concluded he was a Windows 95 user.
"The whole idea behind computers..." thing has been ingrained
in these people by the Redmond Propaganda Institute. A rewrite
of history and the constant influx of brainwashing to the MS
minions results in the kind of responses you hear from people
like Scott Kiddy. I didn't check his headers but I'll bet he's
running Windows 95 and interloping here in OS/2 Advocacy for
one reason: to push the Microsoft mantra: "The MS way or no way!"

Because without arithmetic you cannot define an algorithm. Or more precisely, you need a formal system to express an algorithm, and the smallest complete formal system is base-2 arithmetic. (All other formal systems are anyway logically equivalent to it.)

Besides conflating the algorithm with the formal system, are you sure you're not tripping over the fact that data in a computer is commonly considered "numbers" even when it needn't be? I mean, 010001100100111101001111 can be considered with equal plausibility to represent the number 4,607,823 or the word "foo" or the first three bars of the 5th Symphony. And you can call the rules for the manipulation of this and related symbols "arithmetic" or "English grammer" or whatever you like without changing anything interesting.

Anyone whos played a game. Anyone whos done anything that draws anything
on the screen... You at least have to work out offsets in to screen
memory at some point.

Anyone who uses a keyboard, given that you have to convert keyboard key
numbers in to ASCII. And then you have to work out how to draw it on
the screen, or whatever.

How about a mouse pointer? etc etc...

Almost all a CPU ever does is work out what numbers to put where...

If we did, we would reduce the amount of paperwork
cluttering our lives by 99%.

I also thought, that if every law drafted and proposed
in congress or state legislature had to be written
in longhand by the senator/congressman etc. himself,
we would have a lot more sensible laws and less
tripe/paperwork.

Over the history of the human race, many ways of writing have
been created; and the knowledge of how to read many of them has
been lost. Some people spend their lives attempting to rediscover
the key to these languages.

One of the most stunning decipherments of a lost language was
by Michael Ventris, who in the late 1940's and early 1950's
figured out how to read what was known as "Minoan Linear B",
a language discovered on thousands of tablets recovered from
archeology digs on Crete.

And what did those tablets say, once deciphered? According to
"The CodeBreakers" by David Kahn, sample texts read like this:

"Koldos the shepherd holds a lease from the village: 48 litres of wheat."
"At Pylos: five sons of the Ti-nwa-sian weavers (sons of rowers at A-pu-ne-we), two boys."
"Four (or more) slaves of Koradollos in charge of seed-corn."
"One pair of wheels bound with bronze, unfit for service."

The bureaucrat, like the pawnbroker, has a valid claim to
"the oldest profession".

I'm not a computer scientist, so forgive me if I don't know the jargon or
use it incorrectly.

Would you agree that a logical inference engine such as Prolog implements a
usable "formal system" which has reliance on arithmetic at all? I still
think you're deducing that because our current procedural languages expose
the underlying hardware's arithmetic capabilities, the solutions to
problems implemented in these languages are best expressed in this way.

I don't see how you can apply the term "arithmetic" to operations on data
unless the data is interpreted as weighted digits comprising numeric
values. What does character arithmetic or musical arithmetic consist of?

And of course, the vast majority of people who fund and develop
further computer advances since their invention. Scientific
computing, something today's average computer user thinks little
about, has done more to change computers than all of corporate
computing. (software on the other hand is a different story)

Sorry to force more pomposity down your throat, but I'm never comfortable
with the idea of having a laugh at the expense of someone who is having
problems due to technical ignorance or anything else. It strikes me as one
of the nastier aspects of human nature.

Performance is part of what decides the quality of a paging algorithm. All paging algorithms should be (because they aren't very difficult to implement) similar in regards to reliability and defects. I don't know what you mean by robustness in terms of a paging algorithm.

ONLY AVAILABLE IN THE:
U.S.A, VIRGIN ISLANDS, AND PUERTO RICO CANADA*

BE SURE TO GO TO OUR SITE AND CHECK OUT OUR FREE TRIAL.

Call everyone and tell them to throw away all of your old home, office, fax,
pager, voice-mail, and cellular numbers and give them your New "Virtual Office"
800/888 number! The only number any one will ever need.

Are you tired of giving out all of your different phone numbers to everyone?
Wouldn't it be nice to be able to give everyone just ONE phone number that
will find you anywhere you are? Even out of town, or in a restaurant, or even
on the golf course.

Now you can.

We have the answer to all your communication needs. It's called the "Virtual Office".

And this new service is loaded. It comes with features like:

An automated Call Attendant, Live Call Connect (in real time), Fax Sending, Fax Receiving,
Even without a fax machine! E-Mail Notification and Delivery, Without a PC!,
Outbound calling, Low Cost Long Distance Service, Inbound/Outbound 800/888
Number, Worldwide Call Transfer, Call Forwarding, Call Screening, Full Service Voice
Mail, Nation Wide Pager Notification, Conference Calling, Speed Dialing, Auto Dial,
Auto Messaging, Temporary Greeting, Unavailable Greeting, Password Protection,
Pager Notification, and No Equipment or Software to buy, "Ever".

Priced from $9.95* per month, Plus 10.9 cents per minute per event.

That's less than one phone line would cost per month.

For more information please visit our web site:
http://www.mynumber.com

* Based on our best priced plan.
* Canada has a higher per minute rate.

Huh? Since when is unix no game? Unix was made for the
single purpose to run a game (space invaders?) on a pdp-11.

And since then no adventure game I have seen has beaten unix.

Geez - these kids. Unix _is_ a game. Awful front-end for shure,
but hey... And Windows is just a shell for running multiple
sessions of edlin (remember: word for windows - from the guys
who brought you edlin).

If I would work to get done, I wouldn't use a computer.

$50,000.00 for only $5.00 within 2 MONTHS?????
==========

You gotta be crazy! How on earth do you think you can buy 50 grand
for lousy 5 bucks? Well, that's what I was wondering, too until I
came across this letter.

First of all, IT'S PERFECTLY LEGAL! (Call 1-800-725-2161) if you
have any questions about the following opportunity to make
$50,000.00 and that probably WITHIN LESS THAN TWO MONTHS!

Well, here it goes:
A little while back, I was browsing these newsgroups, just like you
are now, and came across an article similar to this that said you
could make thousands of dollars within weeks with only an initial
investment of $5.00! So I thought, "Yeah, right, this must be a joke,"
but like most of us I was curious, so I kept reading. Anyway, it said
that you send $1.00 to each of the 5 names and address stated in the
article. You then place your own name and address in the bottom of the
list at #5, and post the article in at least 200 newsgroups. (There
are thousands) No catch, that was it.

I knew that that was the opportunity I had waited for for a long time.
I thought it was about time that the money of the world gets into the
right hands! OURS, right? I never had a doubt that this thing will
actually work and even if it didn't, what were 5 stamps and $5.00 for
a try?

As I mentioned before, like most of us I was a little skeptical and
a little worried about the legal aspects of it all. So I checked it
out with the U.S. Post Office (1-800-725-2161) and they confirmed
that it is indeed legal!

Now, that's how your story WILL sound like, too if you participate:

Well GUESS WHAT!!... with in 7 days, I started getting money in the
mail! I was shocked! I still figured it would end soon, and didn't
give it another thought. But the money just kept coming in. In my
first week, I made about $20.00 to $30.00 dollars. By the end of the
second week I had made a total of over $1,000.00!!!!!! In the third
week I had over $10,000.00 and it's still growing. This is now my
fourth week and I have made a total of just over $42,000.00 and it's
still coming in ....

Let me tell you how this works and most importantly, Why
it works....also, make sure you print a copy of this article NOW, so
you can get the information off of it as you need it. The process is

very simple and consists of 3 easy steps:

STEP 1: Get 5 separate pieces of paper and write the following on each piece of paper "PLEASE PUT ME ON YOUR MAILING LIST." Now get 5 $1.00 bills and place ONE inside EACH of the 5 pieces of paper so the bill will not be seen through the envelope to prevent thievery. Next, place one paper in each of the 5 envelopes and seal them. You should now have 5 sealed envelopes, each with a piece of paper stating the above phrase and a $1.00 bill. What you are doing is creating a service by this. THIS IS PERFECTLY LEGAL!

Mail the 5 envelopes to the following addresses:

#1 Robert Jezil
114 Jefferson Ave.
Slidell, LA 70460

#2 Phil Walther Jr.
9495 Annapolis Lane North
Maple Grove, MN 55369

#3 C. E. Burkman
170 University Ave. W
Suite 12-129
Waterloo, Ontario
N2L 3E9

#4 A. Bailey
1207 Reeves Road
Plainfield, IN 46168

#5 J. Martin
P.O. Box 2292
Reston, Va. 20190

STEP 2: Now take the #1 name off the list that you see above, move the other names up (2 becomes 1, 3 becomes 2, etc...) and add YOUR Name as number 5 on the list.

STEP 3: Change anything you need to, but try to keep this article as close to original as possible. Now, post your amended article to at least 200 newsgroups. (I think there is close to 18,000 groups) All you need is 200, but remember, the more you post, the more money you make!

Don't know HOW to post in the newsgroups? Well do exactly the following:

FOR NETSCAPE USERS:
1) Click on any newsgroup, like normal. Then click on "To News", which is in the top left corner of the newsgroup page. This will bring up a message box.

2) Fill in the SUBJECT with a flashy title, like the one I used, something to catch the eye!!!

3) Now go to the message part of the box and retype this letter exactly as it is here, with exception of your few changes. (remember to add your name to number 5 and move the rest up)

4) When your done typing in the WHOLE letter, click on 'FILE' above the send button. Then, 'SAVE AS..' DO NOT SEND YOUR ARTICLE UNTILL YOU SAVE IT. (so you don't have to type this 200 times :-)

5) Now that you have saved the letter, go ahead and send your first copy! (click the 'SEND' button in the top left corner)

6) This is where you post all 200! OK, go to ANY newsgroup article and click the 'TO NEWS' button again. Type in your flashy subject in the 'SUBJECT BOX', then go to the message and place your cursor here. Now click on 'ATTACHMENT' which is right below the 'SUBJECT BOX'. Click on attach file then find your letter wherever you saved it. Click once on your file then click 'OPEN' then click 'OK'. If you did this right , you should see your filename in the 'ATTACHMENT BOX' and it will be shaded.

NOW POST AWAY!

FOR INTERNET EXPLORER:
It's just as easy, holding down the left mouse button, highlight this entire article, then press the 'CTRL' key and 'C' key at the same time to copy this article. Then print the article for your records to have the names of those you will be sending $1.00 to.

Go to the newsgroups and press 'POST AN ARTICLE' type in your flashy subject and click the large window below. Press 'CTRL' and 'V' and the article will appear in the message window. **BE SURE TO MAKE YOUR ADDRESS CHANGES TO THE 5 NAMES.** Now re-highlight the article and re-copy it so you have the changes.... then all you have to do for each newsgroup is 'CTRL' and 'V' and press 'POST'. It's that easy!! THAT'S IT! All you have to do is jump to different newsgroups and post away, after you get the hang of it, it will take about 30 seconds for each newsgroup!

REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE!! BUT YOU HAVE TO POST A MINIMUM OF 200

If these instructions are too complex to follow, try Forte's "Free Agent." It is freeware for noncommercial use. To download it, simply use a search utility and type "Forte Free Agent". You should be able to find it.

That's it! You will begin receiving money from around the world within days! You may eventually want to rent a P.O. Box due to the large amount of mail you receive. If you wish to stay anonymous, you con invent a name to use, as long as the postman will deliver it. **JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT.**

Now the WHY part:

This entire principle works because it is in a format of an upside down tree with thousands of branches. Everyone below you will see to it that the tree continues because they want to get money. Those below THEM will continue because THEY want to get the cash etc.

Out of 200 postings, say I receive only 5 replies (a very low example). So then I made $5.00 with my name at #5 on the letter. Now, each of the 5 persons who just sent me $1.00 make the MINIMUM 200 postings, each with my name at #4 and only 5 persons respond to each of the original 5, that is another $25.00 for me, now those 25 each make 200 MINIMUM posts with my name at #3 and only 5 replies each, I will bring in an additional $125.00! Now, those 125 persons turn around and post the MINIMUM 200 with my name at #2 and only receive 5 replies each, I will make an additional $626.00! OK, now here is the fun part, each of those 625 persons post a MINIMUM of 200 letters with my name at #1 and they each only receive 5 replies, that just made me $3,125.00!!! With a original investment of only $5.00! AMAZING! And as I said 5 responses is actually VERY LOW! Average is probable 20 to 30! So lets put those figures at just 15 responses per person. Here is what you will make:

at #5 $15.00
at #4 $225.00
at #3 $3,375.00
at #2 $50,625.00
at #1 $759,375.00

When your name is no longer on the list, you just take the latest posting in the newsgroups, and send out another $5.00 to names on the list, putting your name at number 5 and start posting again.
The thing to remember is that thousands of people all over the world are joining the Internet and reading these articles everyday, JUST LIKE YOU are now!! And this will go on and on and on and on.... get the picture? Well, there's 5,000,000,000 people on the world and most of them will eventually end up being hooked into the internet. So there are virtually unlimited resources. Of course this will work the best at the very beginning so the faster you post, the better for YOU!

So can you afford $5.00 and see if it really works?? I think so! People have said, "what if the plan is played out and no one sends you the money? So what! What are the chances of that happening when there are tons of new honest users and new honest works?? I think so... People have said, "what if the plan is played out and no one sends you the money? So what! What are the chances of that happening when there are tons of new honest users and new honest people who are joining the Internet and newsgroups everyday and are willing to give it a try? Estimates are at 20,000 to 50,000 new users, every day, with thousands of those joining the actual Internet. Remember, play FAIRLY and HONESTLY and this will work. You just have to be honest. Make sure you print this article out RIGHT NOW, also.

Try to keep a list of everyone that sends you money and always keep an eye on the newsgroups to make sure everyone is playing fairly.

Remember, HONESTY IS THE BEST POLICY. You don't need to cheat the basic idea to make the money!!

GOOD LUCK to all and please play fairly and reap the huge rewards from this, which is tons of extra CASH. **By the way, if you try to deceive people by posting the messages with your name in the list and not sending the money to the rest of the people already on the list, you will NOT get as much. Someone I talked to knew someone who did that and he only made about $150.00, and that's after seven or eight weeks! Then he sent the 5 $1.00 bills, people added him to their lists, and in 4-5 weeks he had over $10k. This is the fairest and most honest way I have ever seen to share the wealth of the world without costing anything but our time!!! You also may want to buy mailing and e-mail lists for future dollars.

Please remember to declare your extra income. Thanks once again...

1147. This news group is invited to a Secret online book ! All Ages Welcome!

We are a New York based international photo agency representing professional and amateur photographers in search of having their work promoted in order to conduct their profession or hobby minus the time consuming inconvenience of presenting and selling their own work.
You do not have to be a professional photographer to sell your photographic work successfully, and as any pro will tell you, quite often throughout history an amateur stumbles on a scene that he or she photographs and ends up with a photo that becomes a classic. Those who publish magazines, books, newspapers, greeting cards, record albums, or just about anyone who works with images in their profession, are in desperate need of fresh material, and are more than willing to review photos submitted by professional photo representatives. Sometimes the photos of amateurs are sought after more so than professionals because of accidental originality and innovative themes.
At Photo Phoenix International, we delight in and value the work of people who view photography as a fine art and understand a photo representative's significance in terms of a photographer's career, reputation, and monetary gain.
The photos we are seeking are some of the following: ANIMALS, ARCHITECTURE, ART, AUTOMOBILES, BUSINESS, CELEBRITIES, DOCUMENTARY, ENTERTAINMENT, EROTICA/NUDITY, FASHION, FOOD, HEALTH, HISTORY, HOBBIES, OUTDOORS, PEOPLE, POLITICAL, PORTRAITS, STILL LIFES, RELIGIOUS, SCIENCE, SPORTS, TRAVEL . . .
Whether your work portrays conservative, experimental, stylish, or innovative themes, your project proposal should be well thought out before submitting to us.
For first contact, submit a query letter and "SAMPLES ONLY" of your photos.
You must include "2" self addressed, stamped envelopes--one for correspondence, the other for the return of your material should we not be interested.
If we think your work is sellable, we will respond as soon as possible. Do not send entire portfolio unless we ask for it.
SEND TO: Photo Phoenix International

One-Number service puts you in control of your calls while ensuring that your calls, messages and faxes reach you regardless of your location. One-Number service does this by linking your existing telephones, cell phones, pagers, and fax machines through a single telephone number.

YOUR One-Number ACCOUNT COMES STANDARD WITH THESE FEATURES
- Consolidates your phone, fax, voice-mail and paging services
- Works with your existing products and services, no need to change
- Easily lets you designate yourself as available or unavailable
- Rings you at up to three numbers simultaneously
- Never-busy number accepts multiple incoming calls and faxes
- Call Screening (by name) lets you know who is calling
- Call Waiting lets you know somebody else is calling
- Call Move lets you easily transfer calls among different phones
- Call Conferencing allows conferences with other parties
- Fax Notification on your pager for incoming fax messages
- Redirect calls to Personal Operator (live person) if desired
- AND MUCH MORE

Virtual Office Communications Company is not a phone company, a long distance carrier, nor do we sell telephone equipment, cellular phones, cellular service, pager or pager service.
Instead, we offer service to integrate your existing products, adding value to what you already have by letting your phones, pagers, fax machines and voice-mail systems work together seamlessly.

To learn more please visit our web site at: http://www.mynumber.com

Please do not reply by e-mail as we are not set up to respond to e-mail requests.

Hello sports fans..

You thought that the A4000T pricing is absurb, check this out..

Just got this off a web site. Apparently there are currently 68040 boxes still being sold. This box is called a Hades and runs on the old defunct Atari TOS operating system. I could not believe the pricing on this.

Here is what you get for $2499 for the 040 and $2999 for the 060 version.

The SuperMac C500/180 Mac OS clone is Umax's least expensive lowend that is priced at $945 and is more powerful than the $2499 box.

This 040 Box does not have web development tools, inadequate internet tools and so on.

However the Mac OS clone costs less does more and has all the rich web/internet apps available..

Technical Specifications:

Case:

Full size tower case with 6 - 5.25" open front bays (one is used for floppy), 3 - 3.5" internal bays, 250 Watt power supply, dual fan ventilation system, CSA / UL approved.

Dimensions: 620mm (H) x 190mm (W) x 455mm (D) Weight 2.5 Kg.

Installed Peripherals:

Keyboard: AT 101 key.
Floppy: 1 with DD, HD and ED compatibility.
Hard Drive: Quantum 850 Mb EIDE Hard Drive.
Memory: 4 Mb minimum, expandible to 1 Gigabyte via 8 slots, 72 pin (PS/2) SIMM.
